## Hepatitis B — The Pursuit of Functional Cures — Bepirovirsen Comes to the Forefront

**Key Message:** Chronic Hepatitis B impacts ~300M individuals WW, and is broadly incurable leading to liver fibrosis, cirrhosis, and deaths in many. Next-gen therapies, led by bepirovirsen (GSK / IONS) has the potential to be practice changing, in a setting where SoC functional cure rates are ≤4%. In the attached Deep Dive, we highlight the potential of HBV suppression and immune-mediated medicines to achieve clinically meaningful cure rates, that could unlock multi-billion dollar annual sales. In conjunction, we conducted a prescriber survey—which indicate broad interest in bepirovirsen, and hosted an HBV expert call—with takeaways ([Here](#)).

**Guggenheim 360°: The Ecosystem of Our Best Research.** The Guggenheim 360° series spotlights our analysts' most differentiated work—research that reflects a deep understanding of our covered industries, primary studies using proprietary methods, access to subject matter experts, thought-provoking conclusions, and actionable portfolio ideas.

### Addressing the Unmet Need in Chronic Hepatitis B — The Quest for a Functional Cure

Standard of care, particularly nucleos(t)ide analogues (NA), have made HBV a treatable and controllable disease. However, despite treatment advances, HBV infection remains broadly incurable, with approximately 300M (per CDC) people infected worldwide, and ~10% diagnosis rate WW. We estimate the U.S. chronic Hep B population at 1-2 million individuals and addressable market of ~250,000. Infected individuals face an elevated risk of liver fibrosis, cirrhosis, and hepatocellular carcinoma, with more than 800,000 deaths attributed to HBV-related complications annually. Treatment of HBV with nucleos(t)ide analogues (NAs) decrease HCC risk by effectively decreasing viral load and inflammation. Even so, HCC rates vary between 0.6% and 9.2% on NA therapy depending on ethnicity and underlying cirrhosis status. U.S. and EU guidelines view functional cure as achievable and defined as sustained HBsAg loss (based on assays with lower limit of detection [LLOD] ~0.05 IU/mL) in addition to undetectable HBV DNA 6 months post treatment. In the ongoing Ph 3 trials of bepirovirsen (GSK / IONS), HBsAg loss in ≥15% of patients is deemed clinically significant. This is highly congruent with the results of our Hepatitis B prescriber survey (below) which indicate a functional cure rate of >20% would support broad adoption.

### Bepirovirsen's Poised to be a \$2B+ product

Oral NA treatment results in a functional cure rate of 1-2%. Bepirovirsen Ph 2, stratified by baseline HBsAg titers ≤3,000 IU/mL, demonstrated functional cure rates of 16% to 25%, which represents the first program to provide meaningful functional cures in the absence of external immunomodulators. Research into bepirovirsen's mechanism of action suggests efficacy may be driven by a combination of ASO-based RNA interference and intrinsic immunomodulator activity. We note, in the SONIC-B database (<https://www.ncbi.nlm.nih.gov/pmc/articles/PMC9159342/pdf/jiaa192.pdf>), approximately 40% of HBeAg-negative patients had HBsAg titers ≤3,000 IU/mL, suggesting a large addressable population based on the HBsAg inclusion criteria. In the bepirovirsen Ph 3 B-Well clinical trials, recapitulation of the Ph 2b data including strength of signal, durability of response, and confirmation of the subgroup analysis will help identify patient cohorts who are more likely to respond to treatment and lead to commercial adoption of >26% in eligible patients, per our HBV prescriber survey. Additional clinical trials will help elucidate bepirovirsen's role in future treatment combinations including, combination with JNJ-3989 (siRNA).

### Will siRNA + Newer Immunomodulator Combos or Additional Recent Breakthroughs Match Bepirovirsen efficacy?

Bepirovirsen has achieved durable functional cure without an added immunomodulator, relative to siRNAs which have sought combination with interferon or newer

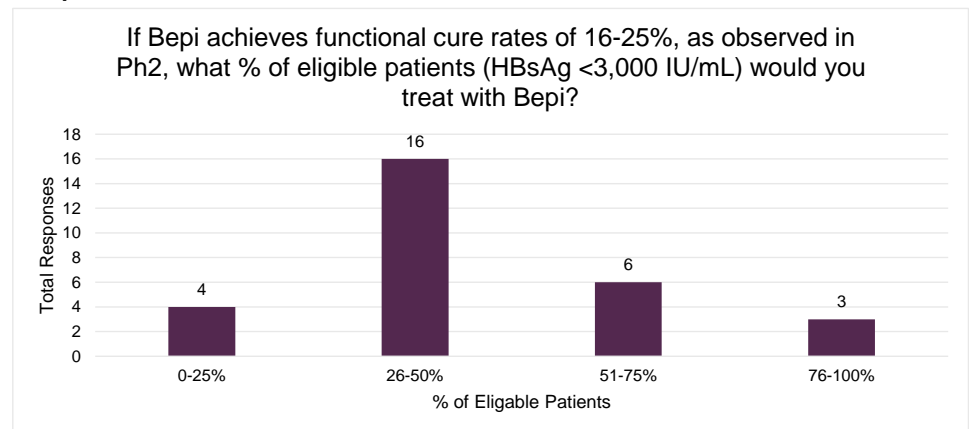

immunomodulators and is considered most likely 'backbone' of future combinations, per our survey. While data appears to show bepirovirsen has an innate advantage over siRNAs given its intrinsic immunomodulatory mechanism, data from VIR and ROG-SWX have highlighted combo data of siRNAs with immunomodulators like peg-IFN, TLR7 agonists, and HBV therapeutic vaccines that show higher rates of surface antigen loss and more sustained response vs. siRNA monotherapy. Newer siRNAs (**VIR, ROG-SWX, NOVO.B, ABUS, GSK**) and immunomodulators look to improve upon pegIFN including checkpoint inhibition, TLR agonists (**GILD, ROG-SWX, Primmune Therapeutics** [private]), and therapeutic vaccines (**BRII-B, VBIV, Viravaxx** [private], **BRNS, HOOK**). Additional classes of Hepatitis B targeted therapies such as monoclonal antibodies (**VIR, Bluejay Therapeutics** [private]), HBsAg inhibitors (**Replacor** [private]), and capsid inhibitors (**ENTA, ALGS, ASMB**) could be additive as part of a combo regimen. *For our EASL 2024 Hepatitis B & D coverage, please view [EASL 2024 Field Report: Viral Hepatitis Updates Recap](#).*

### Genome Editing for HBV — In Pursuit of the “Holy Grail”

The potential of a curative genome editing approach to HBV is the “holy grail” of Hepatitis B treatment. If the Hepatitis B virus can be fundamentally **epigenetic silenced** or ARCUS cleaved (**DTIL**) in a durable manner, genome editing could offer a one-and-done option for CHB. Extra hepatic reservoirs of the Hepatitis B virus do exist, particularly within bone marrow and other lymphatic tissues. However, this does not appear to be a concern for LNP-based liver directed treatment, as these extra hepatic reservoirs are viewed as non-replicative and of uncertain significance in regard to target effect.

# Executive Summary

## Key Takeaways: The Pursuit of Functional Cures in a Large, Unmet, Market

### **Bepirovirsen highlights the potential of HBV suppression and immune-mediated medicines in Hepatitis B, validating the achievement of functional cures above standard-of-care rates**

- Phase 2b data from bepirovirsen demonstrate functional cures in 16-25% of patients with low baseline Hepatitis B surface antigen (HBsAg)
- Current standard of care suppresses HBsAg but only induces functional cures in 1-4% of patients

### **Hepatitis B has become an area of high strategic interest, as global Biopharma increases investment and SMID-cap Biotech companies explore cutting edge modalities**

- GSK / IONS view bepirovirsen as a “backbone” to its Hepatitis B efforts, with estimated peak sales of > \$2B annually
- Multiple classes of medicines with recent breakthroughs have provided encouraging results, including: (1) RNAi-based therapy with either ASO or siRNA; (2) S antigen lowering monoclonal antibodies, capsid assembly modulators; and (3) immunomodulators, including therapeutic vaccines, PD-1/PD-L1 inhibitors, TLRs agonists, and novel interferons; while (4) preclinical DNA and epigenetic editing approaches may offer one-time curative approaches

### **Addressing the Unmet Need in Chronic Hepatitis B**

- Standard of care, particularly nucleos(t)ide analogues (NA), have made HBV a treatable and controllable disease. However, despite treatment advances, HBV infection remains broadly incurable, with approximately 300M (per CDC) people infected worldwide. It is estimated ~35% of infections are diagnosed in the US, ~25% in Europe, and ~50% in Japan
- Infected individuals face an elevated risk of liver fibrosis, cirrhosis, and hepatocellular carcinoma, with more than 800,000 deaths attributed to HBV-related complications annually

## Key Takeaways: Hep B Prescriber Survey Results and EASL 2024 Highlights

### **We conducted a propriety survey of Hepatitis B prescribers to gauge interest in bepirovirsen**

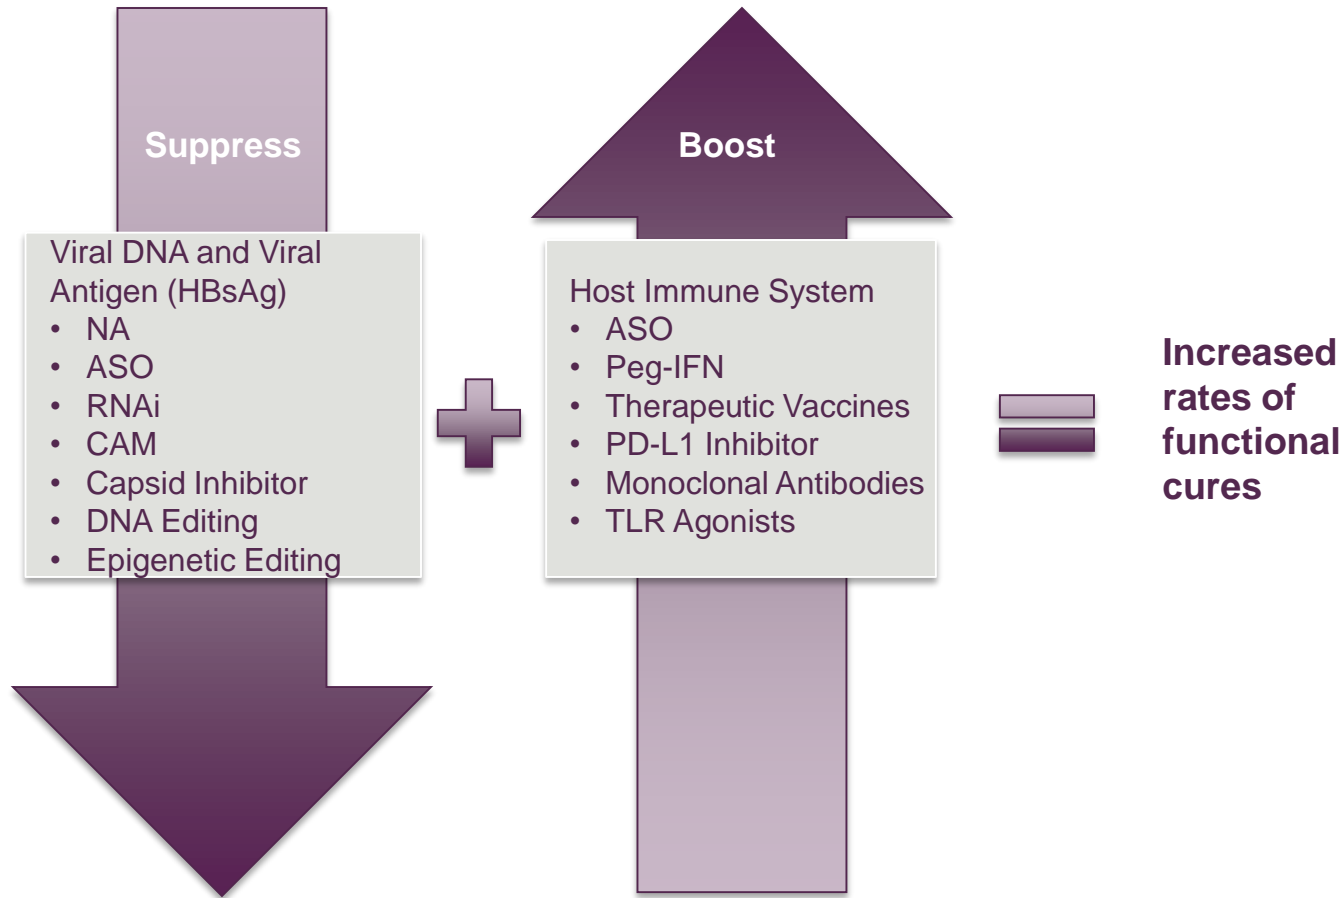

- Across 29 prescribers, who on average treat 86 HBV patients, 93% of prescribers view bepirovirsen as the most likely future 'backbone' of functional cure HBV treatments
- Should the bepirovirsen Ph3 program recapitulate Ph2 (functional cure rates of 16-25%), 86% of prescribers would treat at least 26-50% of their eligible HBV patients
- Most prescribers (97%) would like to see a functional cure rate of >20% to use bepirovirsen in a majority of their eligible patients

### **EASL 2024 Takeaways – ASO / siRNA combinations with immunotherapies lead the development landscape**

- Effects of combining siRNA with PD-1 appear minimal during on-treatment periods, per the JNJ-3989 / nivolumab OCTOPUS-1 trial. On safety, overall the nivolumab dose was low, though there were 2 cases of reversible TSH elevation that led to withdrawal of PD-1 administration
- Effects of combining JNJ-3989 (siRNA) with a DNA vaccine, JNJ-0535, demonstrated NA treatment stopping in 7 (30%) of patients, and enhanced CD4 and/or CD8 polypositive HBV-specific T-cells in 33% of patients. However, no patients achieved HBsAg seroclearance
- HBV targeted siRNA xalnesiran (ROG-SWX), PIRANGA Ph2 Trial - siRNA + immunomodulator (pegIFN or TLR7) - show best responses with + pegIFN combo through 48 weeks post end of treatment. Across all arms, HBsAg loss and seroconversion were observed only in participants with HBsAg < 1000 IU/mL. HBsAg seroconversion at its 48-week follow-up was 17% (vs. 20% at 24-weeks)

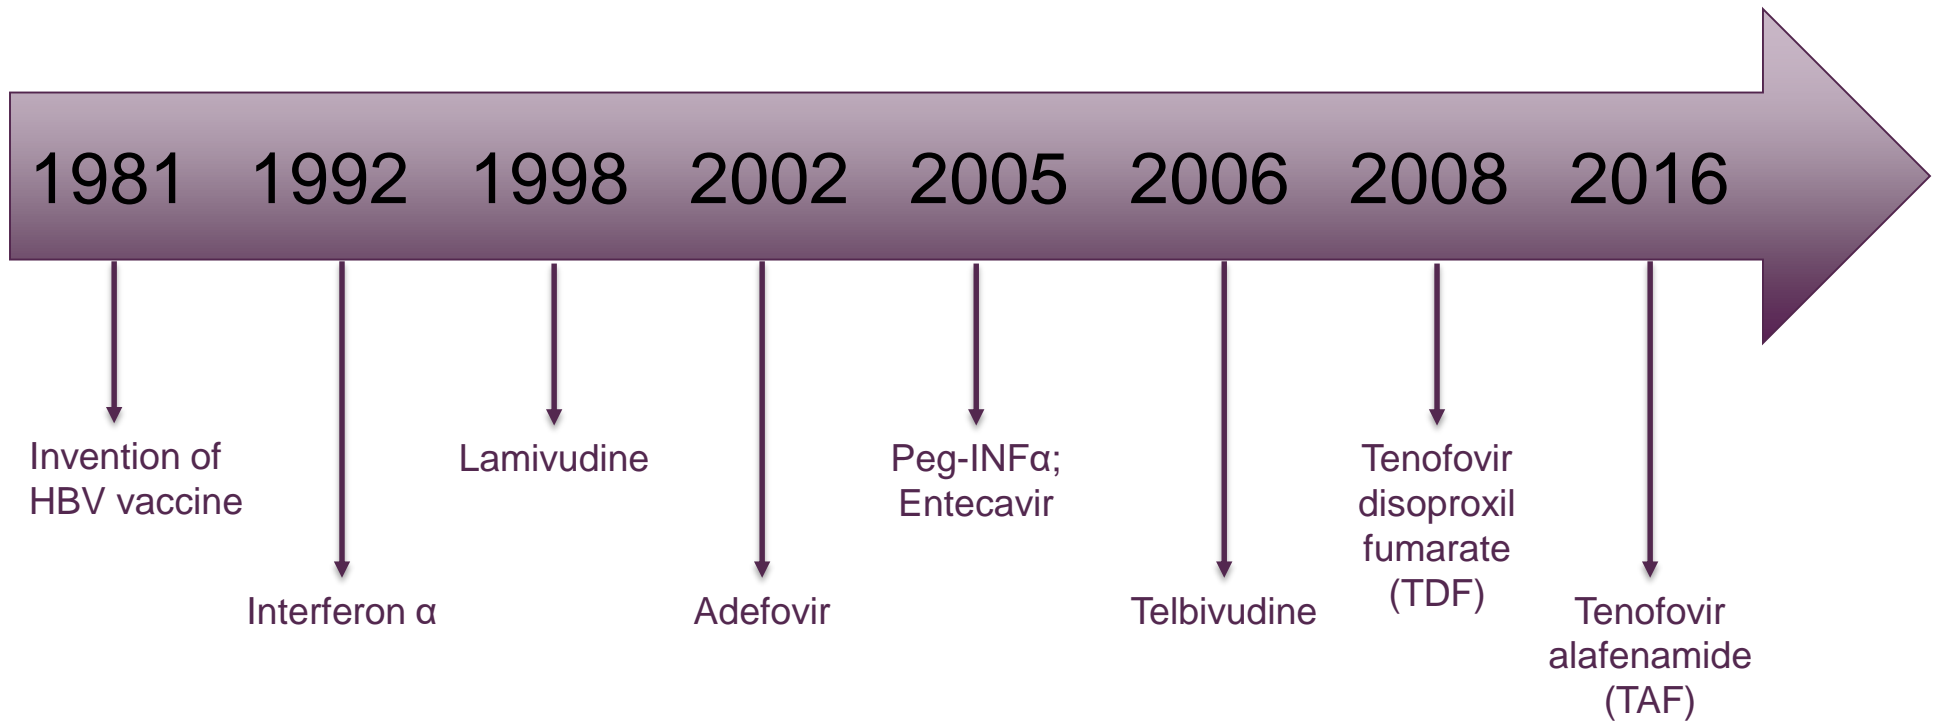

# Functional Cure Success Will Likely Involve HBV Suppression and Immune System Activation

## Development and Approval of HBV Therapies in the US

### Potential Future HBV Therapies and Estimated Approvals

- Bepirovirsen – 2027
- Bepirovirsen + JNJ-3989 – Late 2020s
- ASO  $\pm$  siRNA + immunomodulator – Early 2030s
- ARCUS Editing – Early 2030s
- Epigenetic Editing – 2030s

# Functional Cure Clinical Data - Bepirovirsen Data Review

# Bepirovirsen Induced Functional Cures in 16-25% of Patients with Low Baseline HBsAg

Proportion of Participants (A) On-NA and (B) Not-on-NA Achieving Primary Outcome in bepirovirsen Ph2b B-Clear Trial

In the Ph2 B-Clear Study, the composite primary outcome was a Hepatitis B surface antigen (HBsAg) level below the limit of detection and an HBV DNA level below the limit of quantification maintained for 24 weeks after the planned end of bepirovirsen treatment, without newly initiated antiviral medication.

In the group receiving bepirovirsen 300mg for 24 weeks, a total of 16% of the participants receiving NA therapy and 25% of participants not receiving NA therapy with a low HBsAg level ( $\leq 3,000$  IU/mL) at baseline had a primary-outcome event, as compared with 6% and 7% of participants, respectively, with a high HBsAg level ( $>3,000$  IU/mL) at baseline.

■ Arm 1: bepirovirsen 300 mg w/ LD x24W     
 ■ Arm 2: bepirovirsen 300 mg w/ LD x12W + bepirovirsen 150 mg x12W  
■ Arm 3: bepirovirsen 300 mg w/ LD x12W + placebo x12W     
 ■ Arm 4: placebo x12W + bepirovirsen 300 mg w/o LD x12W

# Bepirovirsen; Genotype A and D May Be More Responsive

## Results of the bepirovirsen Ph 2b B-Together Study

| Overall N=108                                              |           |        |           |            |           |                |              |
|------------------------------------------------------------|-----------|--------|-----------|------------|-----------|----------------|--------------|
| Genotype                                                   | A         | B      | C         | D          | E         | H <sup>a</sup> | Undetermined |
| <b>N</b>                                                   | 9 (8%)    | 3 (3%) | 26 (24%)  | 10 (9%)    | 5 (5%)    | 1 (<1%)        | 54 (50%)     |
| <b>Mean HBsAg (log IU/mL) at baseline</b>                  | 3.55      | 3.49   | 3.29      | 3.36       | 3.31      |                | 3.28         |
| <b>Mean reduction HBsAg (log IU/mL) at EOT</b>             | -2.90     | -1.74  | -1.51     | -2.11      | -1.42     |                | -1.56        |
| <b>Mean reduction HBsAg (log IU/mL) at OT-W24</b>          | -1.90     | -1.06  | -0.92     | -1.90      | -0.95     |                | -1.54        |
| <b>Number (%) of participants achieving PE<sup>b</sup></b> | 2/9 (22%) | 0/3    | 1/26 (4%) | 2/10 (20%) | 1/5 (20%) | 0/1            | 7/54 (13%)   |

<sup>a</sup>Mean HBsAg data not included for GT with N ≤1 (i.e., Arm 2 GT-B, GT-H); <sup>b</sup>Denominator indicates number of participants with data available at OT-W24.

Participants with genotype C had the lowest baseline mean HBsAg level (3.29 log<sub>10</sub> IU/mL) and genotype A had the highest (3.55 log<sub>10</sub> IU/mL).

Participants with genotype A and genotype D had the greatest mean reduction in HBsAg at OT-W24 (-1.90 log<sub>10</sub> IU/mL) and genotype C had the least (-0.92 log<sub>10</sub> IU/mL) following bepirovirsen and peg-IFN.

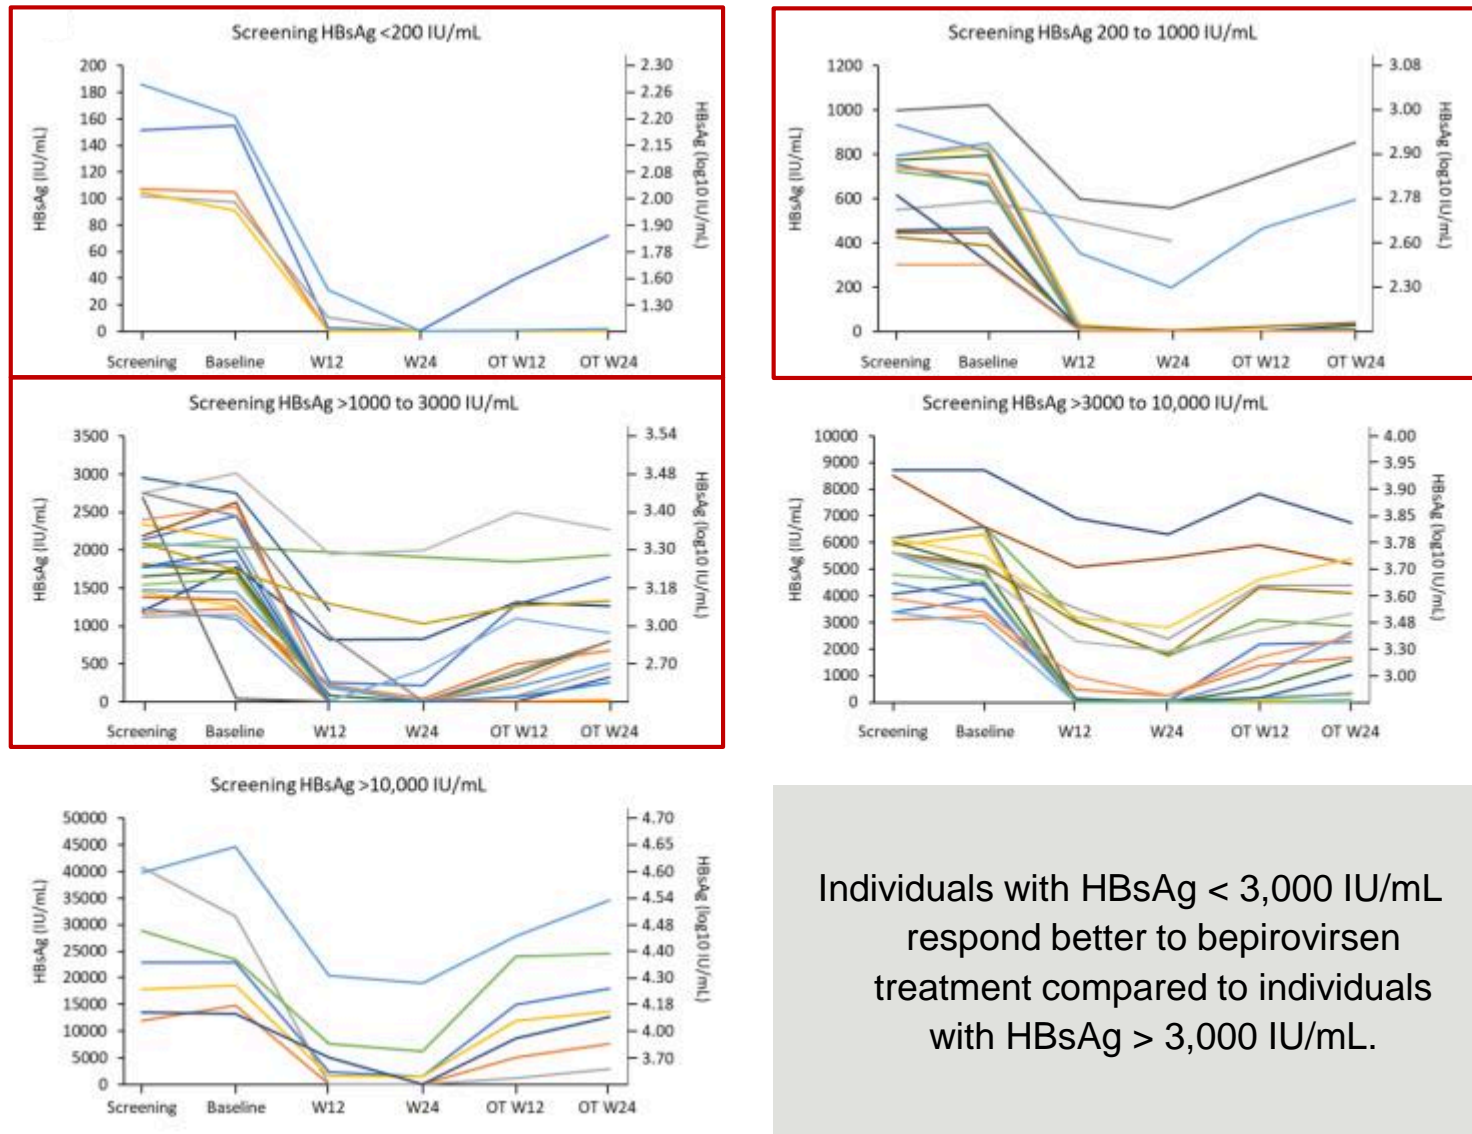

Baseline genotype data was insufficient to perform a robust statistical analysis of response by genotype.

### Maximum reduction in HBsAg at 24 weeks post treatment

## Bepirovirsen; Hepatobiliary Laboratory Findings

| Laboratory criteria                     | On-NA population (n=226) | Not-on-NA population (n=230) |
|-----------------------------------------|--------------------------|------------------------------|
| N                                       | 225                      | 227                          |
| ALT $\geq$ 3x ULN and BIL $\geq$ 2x ULN | 0                        | 2 (<1)                       |
| ALT $\geq$ 3x ULN and INR $\geq$ 1.5    | 0                        | 0                            |
| ALT $\geq$ 3x ULN                       | 39 (17)                  | 93 (41)                      |

Note: The upper limit of the normal range (ULN) for alanine aminotransferase (ALT) is 40 IU per liter for men and 33 IU per liter for women.

Of the 226 participants, 39 (17%) receiving NA therapy and 93 (41%) not receiving NA therapy had a transient increase in the ALT  $\geq$ 3 times the ULN. At baseline, most participants (91% of those receiving NA therapy and 70% of those not receiving NA therapy) had an ALT level at or below the ULN.

Source: <https://pubmed.ncbi.nlm.nih.gov/36346079/>

# Proportion of Participants Within ALT Categories Over Time—Per our KOL LFT <5x ULN Not a Concern in Non-Fibrotic HBV Patients

In the bepirovirsen Ph IIb trial, B-Clear, the research team analyzed ALT elevations over treatment course ( $\leq$ ULN,  $>$ ULN to  $\leq$ 3xULN,  $>$ 3xULN to  $\leq$ 5xULN,  $>$ 5xULN to  $\leq$ 10xULN,  $>$ 10xULN).

Participants exhibit peak ALT elevations around 8-weeks post treatment initiation.

On-NA patients (A) have less ALT elevations with shorter duration, compared to non-on-NA population (B).

Only 6% of patients had ALT  $>$ 5xULN in on-NA patients and 13%  $>$ 5xULN in not-on-NA patients, with return below 5xULN within one week.

Source: <https://pubmed.ncbi.nlm.nih.gov/36346079/>

# HBsAg Loss is ~85% Durable in Extended Follow Up in Systematic Review of Available HBV Treatments

## Durability of HBsAg loss in observational studies

| Key endpoints  | # of participants achieving functional cure with baseline HBsAg $\leq$ 3000 IU/mL | # of participants achieving functional cure with baseline HBsAg $\leq$ 3000 IU/mL |

- Participants who have documented chronic HBV infection  $\geq$ 6 months prior to screening and currently receiving stable NA therapy defined as no changes to their NA regimen from at least 6 months prior to screening and with no planned changes to the stable regimen over the duration of the study
- The arms will be stratified based on HBsAg level (HBsAg  $\geq$  0 IU/mL to  $\leq$ 1000 IU/mL or  $>$  1000 IU/mL to  $\leq$ 3000 IU/mL) at screening
- Plasma or serum HBV DNA concentration must be adequately suppressed, defined as plasma or serum HBV DNA  $<$ 90 IU/mL
- Baseline alanine aminotransferase (ALT)  $\leq$ 2  $\times$  upper limit of normal (ULN)

## Bepirovirsen Mechanisms of Action

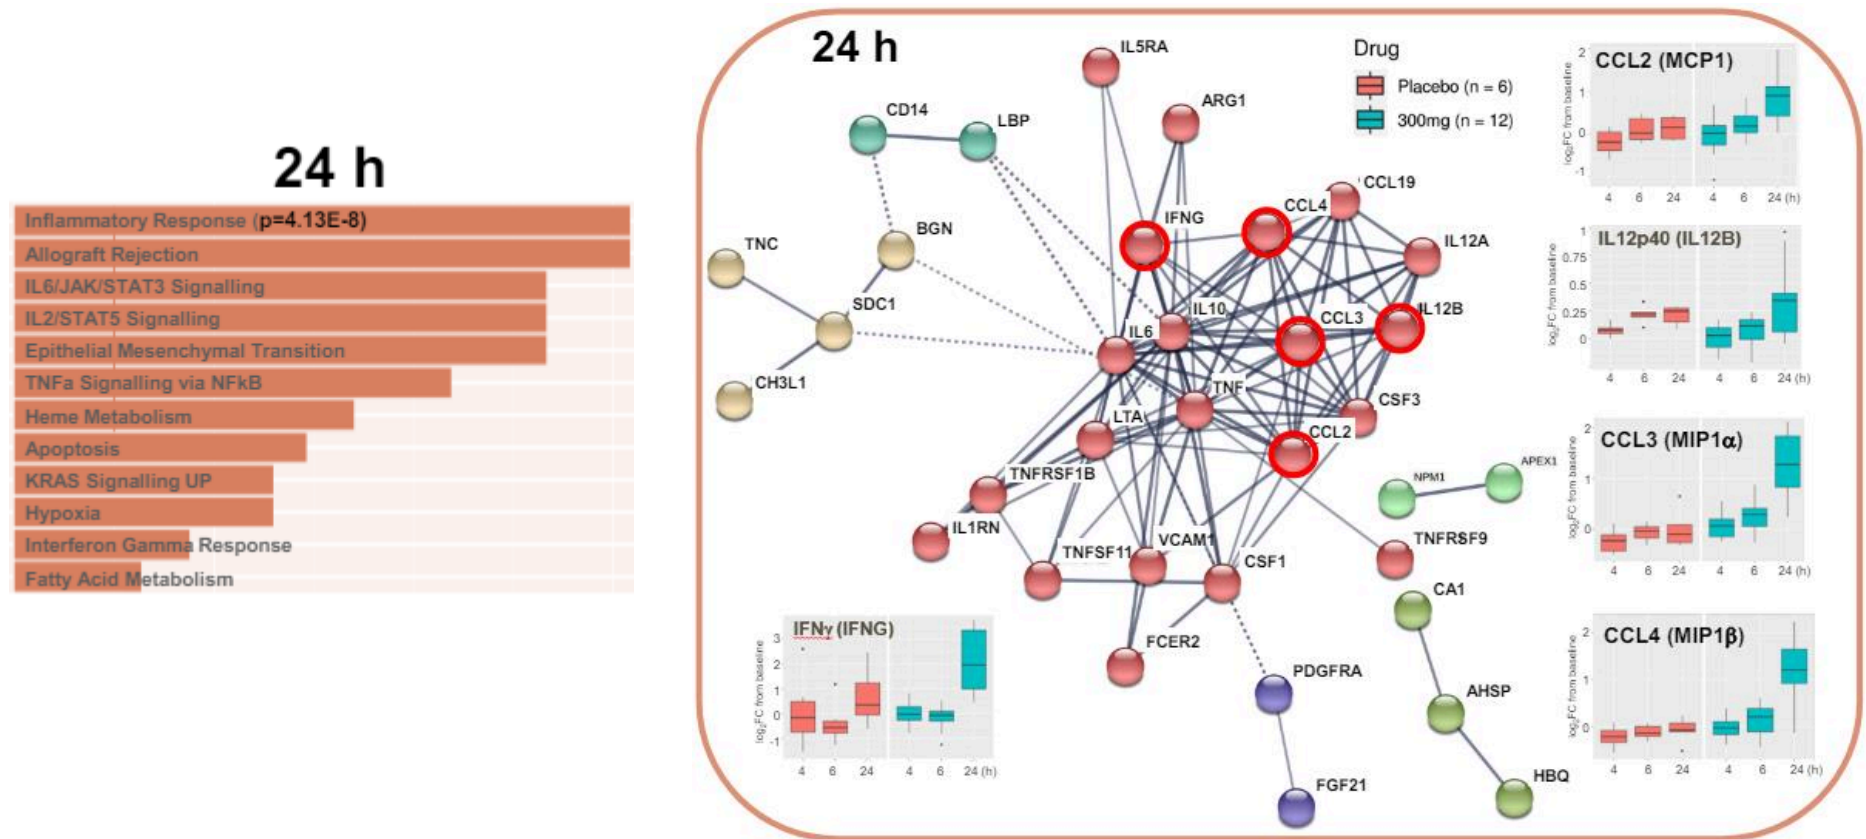

(1) Bepirovirsen (GSK836) may be preferentially distributed to non-parenchymal cells, conferring immune activation of pattern recognition receptors activation (TLR7 and TLR8).

(2) Bepirovirsen provides inhibition of HBV mRNA via standard ASO mechanisms in hepatocytes.

Source: [https://www.postersessiononline.eu/173580348\\_eu/congresos/ILC2022/aula/-SAT\\_439\\_ILC2022.pdf](https://www.postersessiononline.eu/173580348_eu/congresos/ILC2022/aula/-SAT_439_ILC2022.pdf)

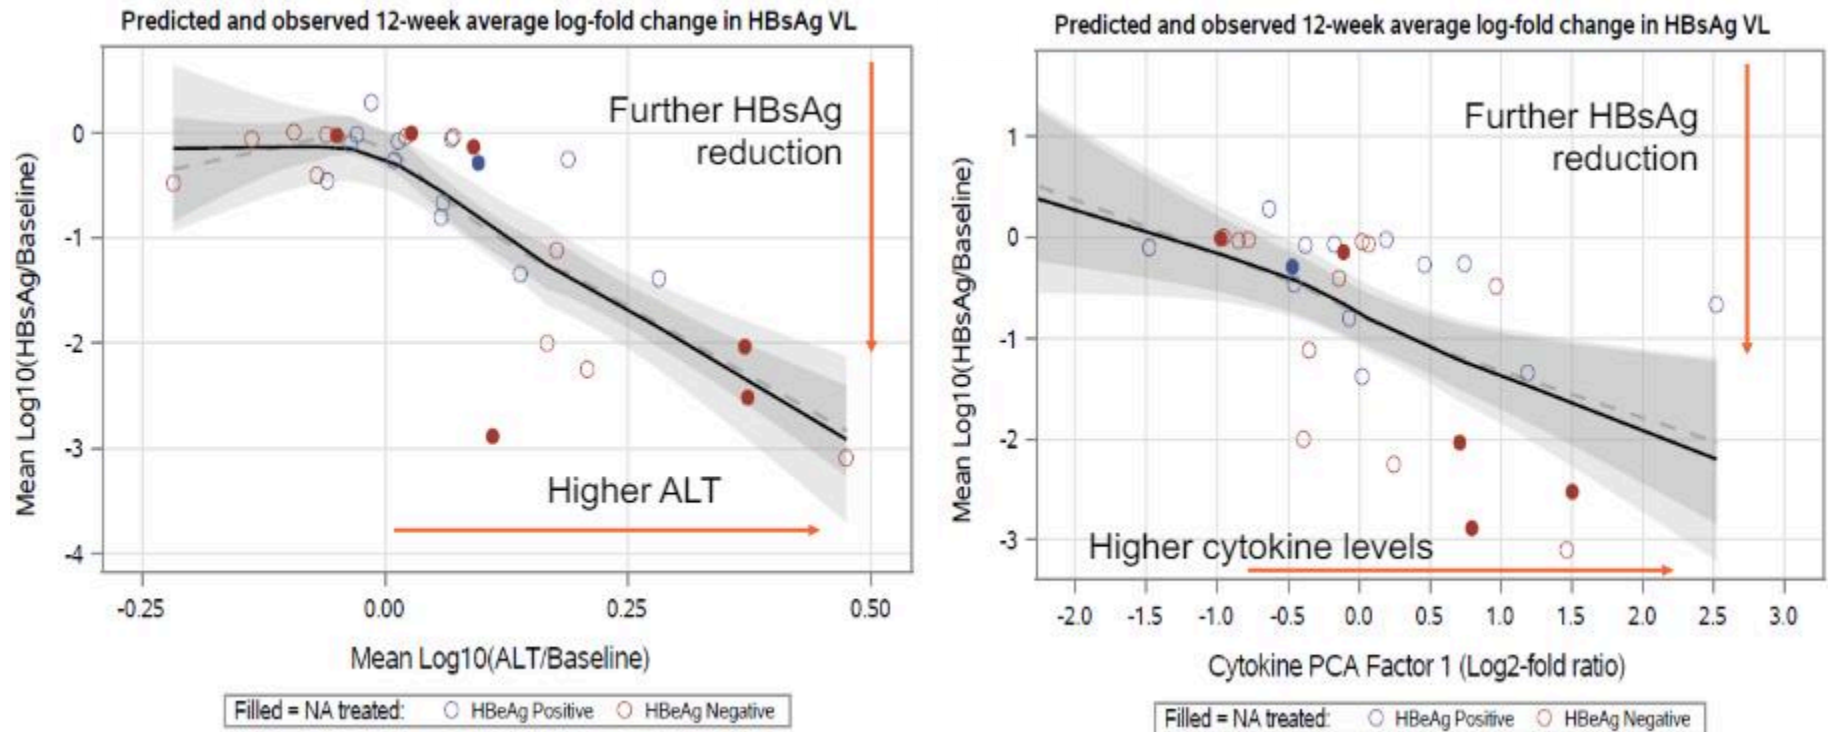

# Bepirovirsen Induces Immune Response Within 24 hrs Post-Treatment

Serum markers upregulated at 24 hours suggest inflammatory response to bepirovirsen with activation of innate and adaptive immune cells. These include: inflammatory cytokines (IFN-g, TNF); recruitment of monocyte/macrophage, NK, and T cells (CCL2, CCL3, CCL4, CCL19); activation of macrophages and neutrophils (CSF1, CSF3) and T cells (IL-12B, CCL19); and lymphocyte activation (TNFSRF9 (T cell), FCER2 (B cell), TNFSF11).

Source: [https://www.postersessiononline.eu/173580348\\_eu/congresos/ILC2022/aula/-SAT\\_439\\_ILC2022.pdf](https://www.postersessiononline.eu/173580348_eu/congresos/ILC2022/aula/-SAT_439_ILC2022.pdf)

## HBsAg Reduction Correlated with ALT Flare and TLR8 Cytokines Activation

ALT flares are highly correlated with HBsAg response (left) and HBsAg reduction trends with greater induction of TLR8 cytokines (right).

Note: TLR8 cytokines measured include: CCL11, CCL2 (MCP-1), CCL20, CCL3, CCL4, CCL5, CCL8 (MCP-2), CSF3, CXCL10, CXCL8, CXCL9, IFN, IL10, IL12p40 (IL12B), IL18, IL1A, IL1B, IL1RN, IL6, and TNF.

GSK obtains exclusive license for the siRNA JNJ-3989 to expand  
the development of bepirovirsen  
- Review of JNJ-3989 Data and License Rationale

# JNJ-3989 Ph 2b REEF-1—Virological Suppression Occurs Following siRNA Treatment

The efficacy and safety of the siRNA JNJ-3989 with NA treatment with-or-without the capsid assembly modulator (CAM) JNJ-6379 for the treatment of chronic hepatitis B across 470 patients in the Ph 2b trial REEF-1.

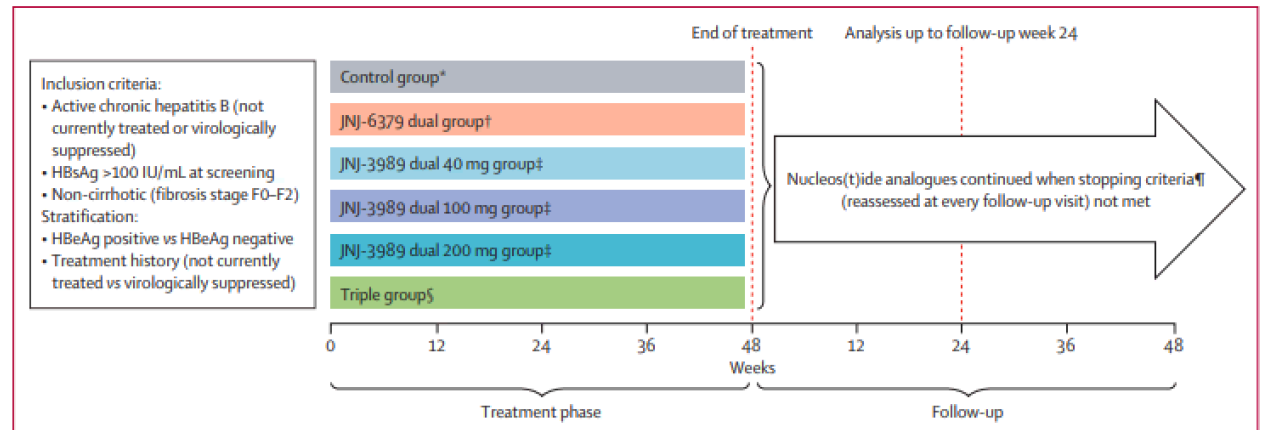

Median baseline HBsAg values were between 3.6 log<sub>10</sub> IU/mL and 3.9 log<sub>10</sub> IU/mL across treatment groups.

63% of patients were virologically suppressed and 70% were HBeAg negative at baseline.

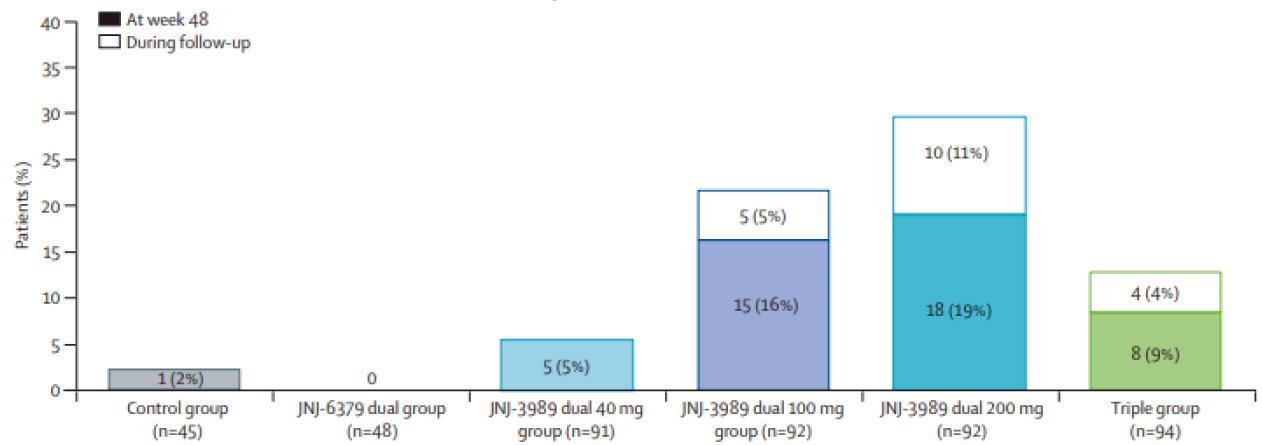

At week 48, the following met the primary endpoint of NA-stopping criteria (ALT <3xULN, HBV DNA < LLOQ, HBeAg negative, HBsAg <10 IU/mL). 5% in the JNJ-3989 dual 40 mg group, 16% in the JNJ-3989 dual 100 mg group, 19% in the JNJ-3989 dual 200 mg group, 9% in the triple group, and 2% in the control group; no patients in the JNJ-6379 (CAM) dual group met stopping criteria.

At the follow-up week 24 analysis, 19 (4%) of 464 additional patients had met NA stopping criteria.

## REEF-1 Trial Design

## Percentage of patients meeting NA-stopping criteria at week 48 and during the 24-week follow-up

Source: <https://pubmed.ncbi.nlm.nih.gov/37442152/>

# JNJ-3989—HBeAg-Negative Participants Respond Better to siRNA Treatment than HBeAg-Positive Participants

38 (81%) patients who met the NA-stopping criteria at week 48 were virologically suppressed and HBeAg negative at baseline. Only a small number of patients from other subgroups met NA-stopping criteria at week 48.

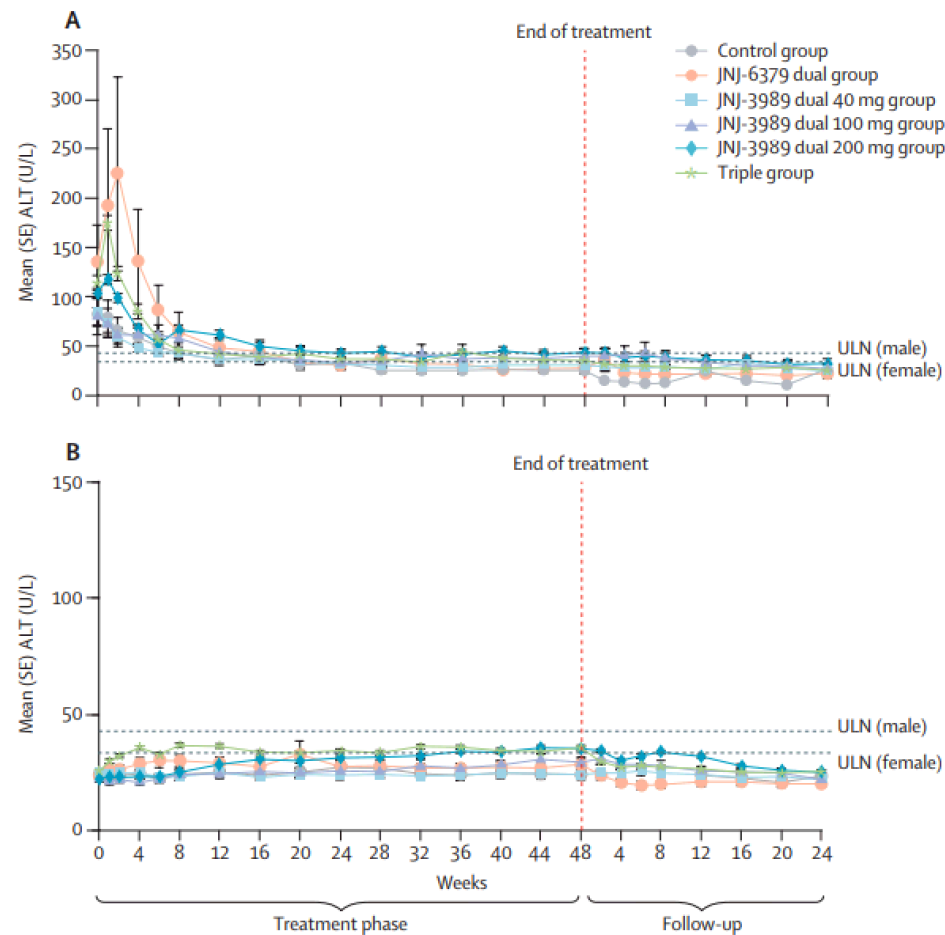

Substantial HBsAg reductions were observed with JNJ-3989 treatment. However, functional cure (off-treatment HBsAg seroclearance) was not reached with the treatments evaluated.

Percentage of patients meeting NA-stopping criteria at week 48 and during the 24-week follow-up by stratification factors

Source: <https://pubmed.ncbi.nlm.nih.gov/37442152/>

## JNJ-3989—ALT Profile Suggests Combination With Bepirovirsen is Feasible

Mean ALT profiles over time in patients who were not currently treated (top) and patients who were virologically suppressed (bottom), reveal limited ALT elevation following siRNA treatment in patients with virologically suppressed CHB.

Source: <https://pubmed.ncbi.nlm.nih.gov/37442152/>

# In the Ph 2 Octopus-1 Study, JNJ-3989 Loading Dose Did Not Lead to HBsAg Declines

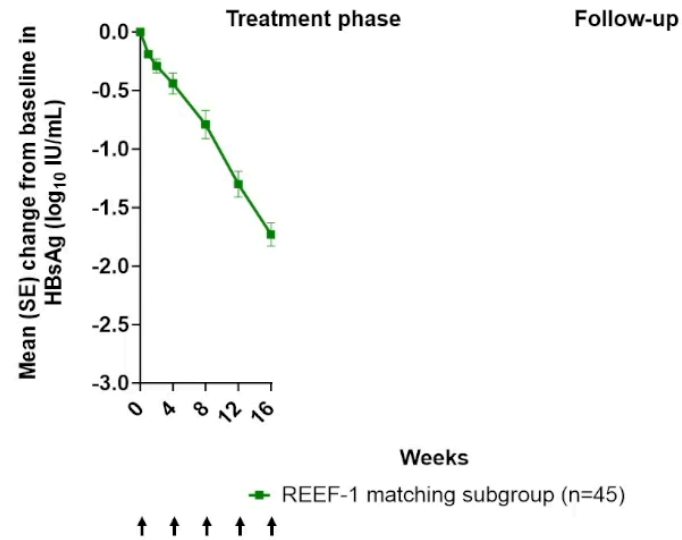

## Octopus-1

JNJ-3989 200 mg Q4W with Q1W LD for first 4 weeks  
 Population: Virologically suppressed, HBeAg negative

## REEF-1

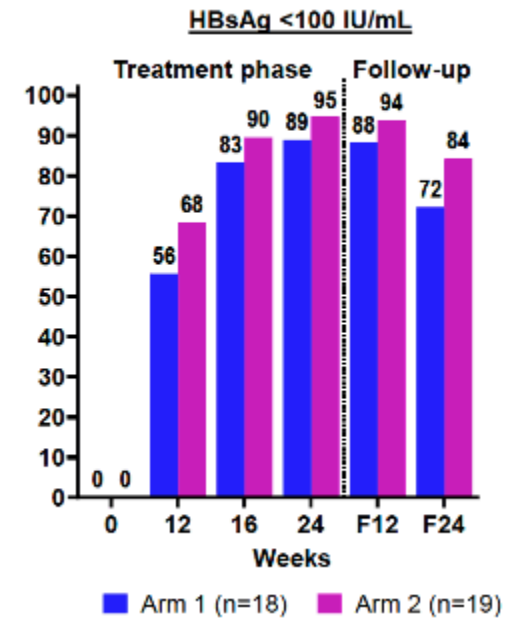

JNJ-3989 200 mg Q4W without loading dose (LD) or nivo  
 Sub-population: Virologically suppressed, HBeAg negative

Increased dose frequency of JNJ-3989 (200 mg Q4W with Q1W loading dose for first 4-weeks) was safe and well tolerated but did not improve HBsAg declines. Mild increases of ALT were observed earlier in Octopus-1 (with loading dose) than REEF-1 (without loading dose).

Source: JNJ EASL 2024 Presentation

# In the Octopus-1 Study, Adding Nivolumab Did Not Add to HBsAg Declines

The addition of nivolumab at low dose with >80% receptor occupancy did not improve the HBsAg declines of JNJ-3989+NA. No participant met the primary endpoint of HBsAg < LLOQ. After two events of temporary TSH suppression, it was deemed nivolumab infusions added no clear benefit and the protocol was amended to remove nivolumab from the study.

Source: JNJ EASL 2024 Presentation

# JNJ-3989, 100 to 400 mg Q4W Resulted in HBsAg Reductions >-1 log<sub>10</sub> IU/ml From Baseline

In a separate Ph2 trial, patients with chronic Hepatitis B were administered siRNA JNJ-3989 plus an NA.

Median HBsAg at baseline (log<sub>10</sub> IU/ml) was 3.14.

Smaller reductions in mean HBsAg were observed with 25 mg (1.00 log<sub>10</sub> IU/ml) and 50 mg (1.18 log<sub>10</sub> IU/ml) vs. 100 to 400 mg (1.48 to 2.39 log<sub>10</sub> IU/ml) JNJ-3989 dosing.

Dose response appeared to plateau above 100 mg.

75% of patients (30/40) had <100 IU/mL at day 112, of those who received 100mg to 400mg JNJ-3989.

Source: <https://pubmed.ncbi.nlm.nih.gov/35870702/>

# 15/39 Patients Maintained > 1 log<sub>10</sub> IU/ml HBsAg Reduction Through Day 392

The mean HBsAg reductions were 1.96 log<sub>10</sub> IU/ml in sustained responders and 0.63 log<sub>10</sub> IU/ml in non-sustained responders

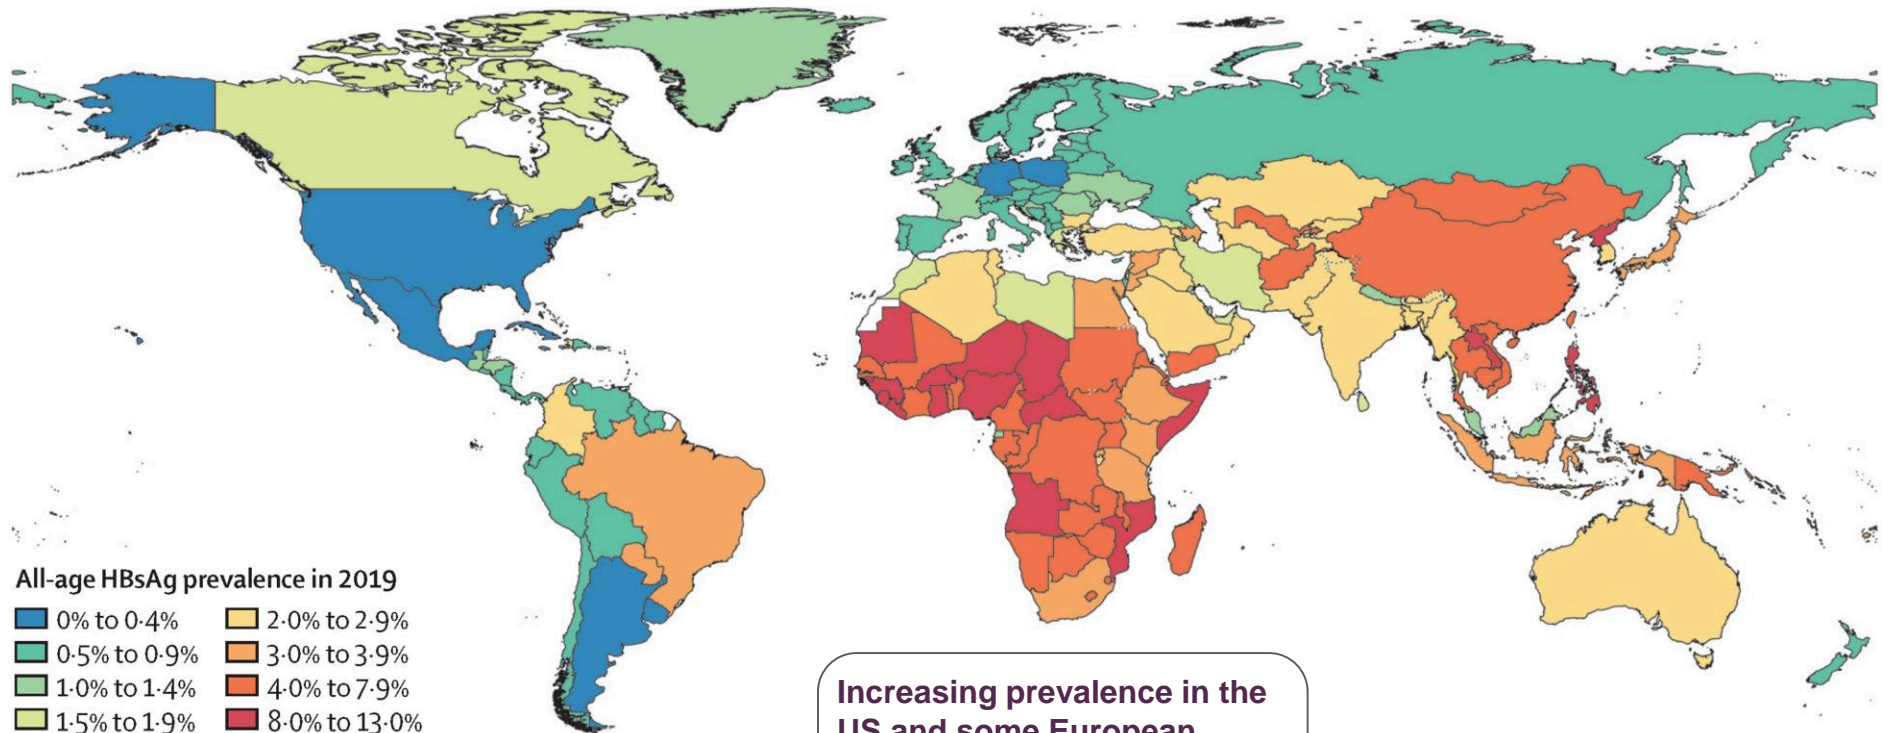

Source: <https://pubmed.ncbi.nlm.nih.gov/35870702/>

# HBV Commercial Opportunity

## - A view of the Current Clinical Landscape

## Chronic HBV Epidemiology and Public Health Burden

- Worldwide there are approximately 300 million chronic HBsAg carriers
- In 2013, there were 686,000 reported deaths from HBV-related liver disease and HCC
- CHB remains a global public health issue and diagnosis remains low. Diagnosis rates are approximately 35% in the US, 25% in Europe and 50% in Japan. Recently, the CDC published guidelines that suggest that adults should be tested for Hepatitis B

**Increasing prevalence in the US and some European countries:**

- Migration from high endemic countries

Source: EASL HBV 2020 Update; [https://doi.org/10.1016/S0140-6736\(22\)01468-4](https://doi.org/10.1016/S0140-6736(22)01468-4)

# US Hepatitis B Epidemiology

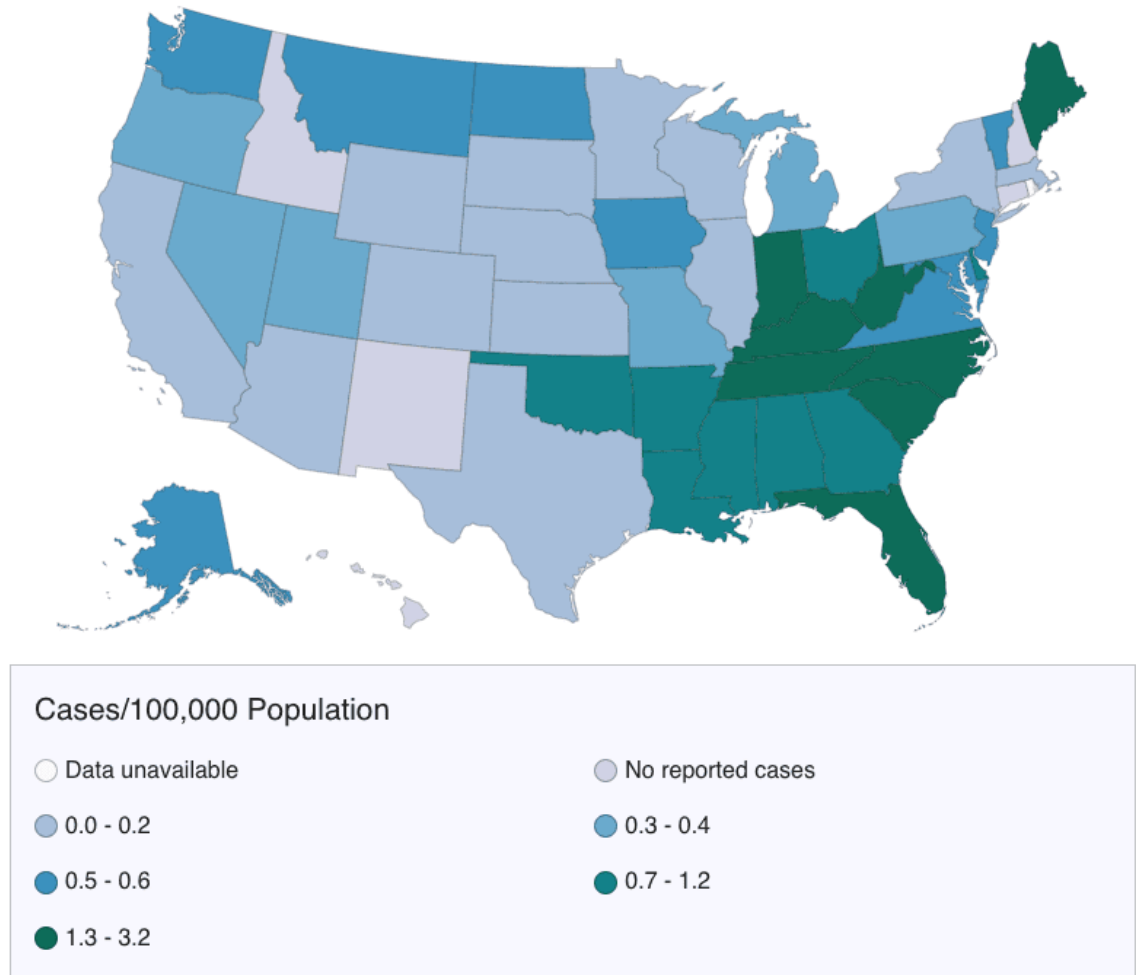

There are an estimated 850,000 to 2.2M people infected with chronic HBV in the US.

Of the chronic population, 15% - 25% die prematurely from cirrhosis or liver cancer.

Asian Americans account for approximately 50% of all US chronic HBV cases.

The CDC estimates there are approximately 4,000 reported acute HBV cases annually, and approximately 20,000 to 25,000 estimated acute HBV infections annually. Per the CDC, the number of estimated cases of acute Hepatitis B is determined by multiplying the number of reported cases by a factor that is adjusted for under-ascertainment and under-reporting; the number of estimated cases is typically about 6.5-fold higher than reported cases.

Rates of Reported Acute Hepatitis B Virus: Rates of Reported Cases, by State or Jurisdiction, United States, 2022

## China is One of the Largest Markets for HBV

The China HBV market is anticipated to reach ~\$3.4B in annual sales by 2029

### Number of HBV infected & treated people in China:

Infected with HBV: ~79M  
 Require treatment per guidelines: ~75M  
 Receiving antiviral treatment: ~11M

### Social Pressures of HBV Infection in China

In a survey of 797 HBV patients in China;  
 Denied jobs due to HBV: 20%  
 Denied health insurance due to HBV: 14.7%

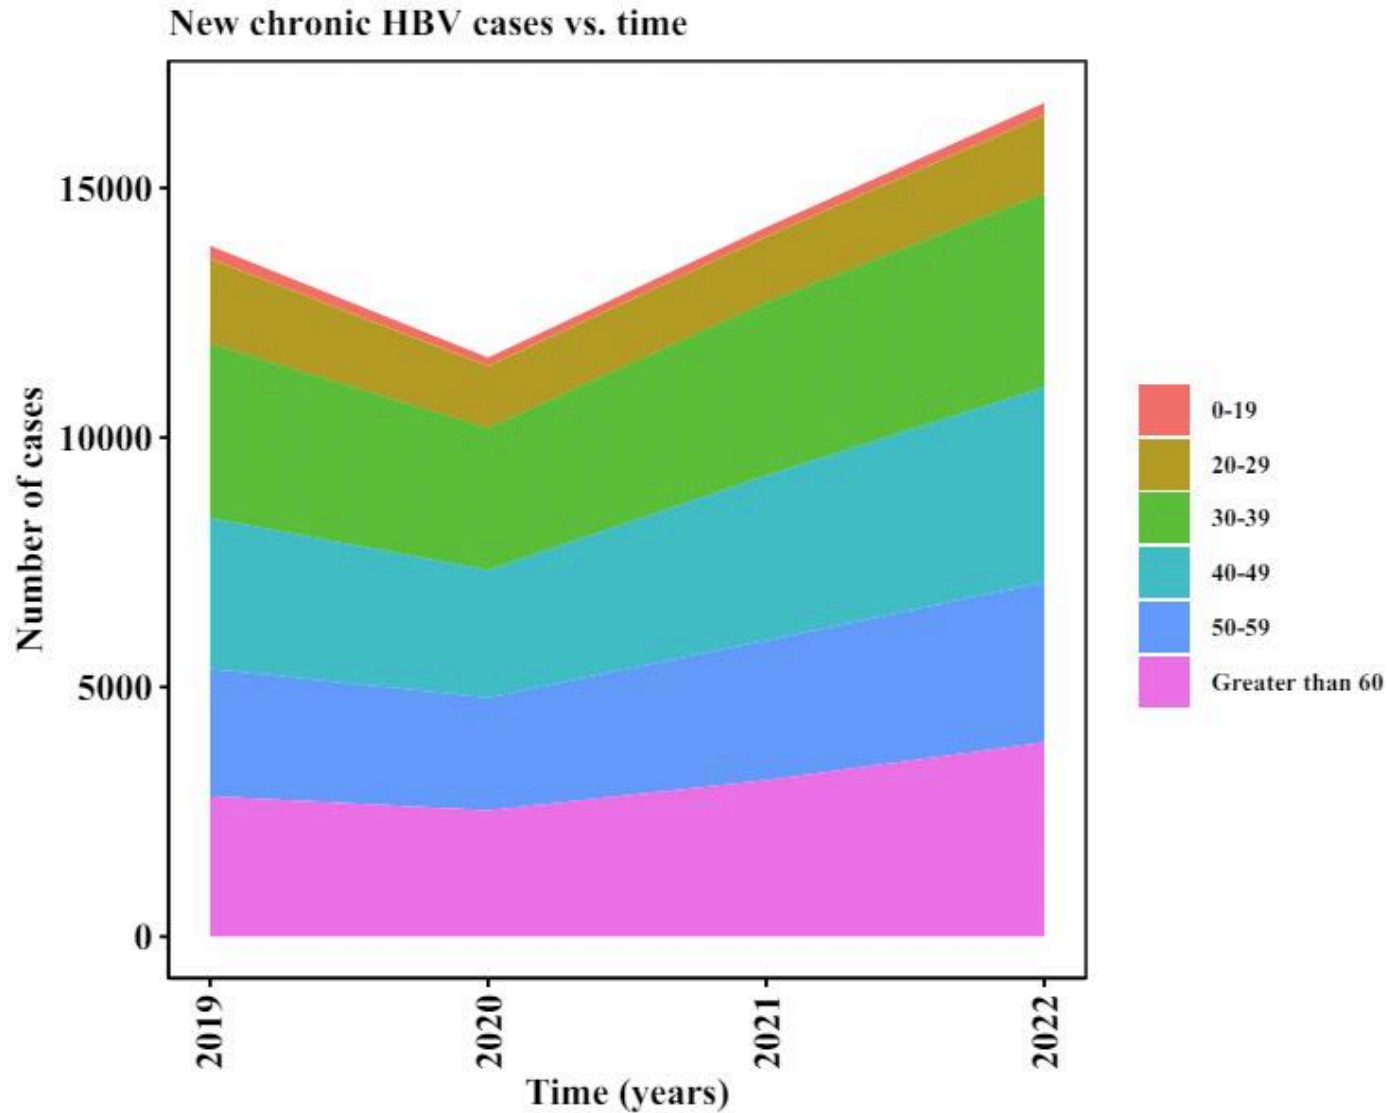

Source: <https://www.ncbi.nlm.nih.gov/pmc/articles/PMC6751646/>; BRII Bio corporate report; ) 2017 survey on discrimination against chronic HBV patients in China conducted by the Chinese Foundation for Hepatitis Prevention and Control

# Chronic Hepatitis B Serology

## -Understanding a Broad Unmet Need

# Hepatitis B Virus Life Cycle

The HBV genome is a relaxed-circular DNA (rcDNA), which is converted into covalently closed circular DNA (cccDNA) in infected hepatocytes. cccDNA produce HBV RNAs mainly of 3.5 Kb, 2.4 Kb, 2.1 Kb, or 0.7 Kb in size. Hbe is produced by the translation of the 3.5 Kb preC mRNA.

HBV enters host cells through surface receptors including heparan sulfate proteoglycans (HSPGs).

cccDNA resides episomally, and functions as a template for viral replication over the long term, with a half-life of up to 9-months in HBV patients.

HBV RNA can undergo capsid formation, followed by reverse transcription and DNA synthesis to form HBV virion particles. These particles can be secreted from the host cell.

## Genotypes of HBV – Genotypes A & B Most Responsive to Treatment

Some patients with chronic Hep B have widely fluctuating HBV-DNA levels that may vary from undetectable to >2,000,000 IU/mL. Thus, serial monitoring of HBV-DNA levels is important.

HBV exists in ten genotypes (A-J). Genotypes A-H are present in the US, and A, B, and C are the most prevalent. Genotype A (vs B, C, D) is associated with greater rates of HBeAg and HBsAg loss with IFN therapy.

HBV genotype B is associated with more sustained remission, less hepatic necroinflammation, slower progression to cirrhosis, and lower rate of HCC development vs. genotype C.

HBV genotype: A and B genotypes are more likely to achieve HBeAg and HBsAg loss with peg-IFN than non-A or non-B genotypes.

| Genotypes | Subtypes | Geographic location                                       |
|-----------|----------|-----------------------------------------------------------|
| A         | A1       | Sub-Saharan Africa                                        |
|           | A2       | Northern Europe                                           |
|           | A3       | Western Africa                                            |
| B         | B1       | Japan                                                     |
|           | B2-5     | East Asia, Taiwan, China, Indonesia, Vietnam, Philippines |
|           | B6       | Alaska, Northern Canada, Greenland                        |
| C         | C1-3     | Taiwan, China, Korea and Southeast Asia.                  |
|           | C4       | Australia                                                 |
|           | C5       | Philippines, Vietnam                                      |
| D         | D1-5     | Africa, Europe, Mediterranean countries and India         |
| E         |          | Restricted to West Africa                                 |
| F         | F1-4     | Central and South America                                 |
| G         |          | France, Germany and the United States                     |
| H         |          | Central America                                           |
| I         |          | Vietnam and Laos                                          |
| J         |          | Japan                                                     |

### Clinical significance of HBV genotypes

#### Geographical distribution

- A – Northwest Europe and North America
- B – SE Asia
- C – Far East
- D – Mediterranean basin, India, Middle East

#### Spontaneous HBeAg seroconversion

- B earlier than C

#### Activity of liver disease and risk of progression to cirrhosis

- C > B

#### Response to IFN

- A better than D
- B better than C

Note: HBV DNA  $> 10^6$  IU/mL per AASLD,  $>10^7$  IU/mL per KASL and EASL

Guidelines recommend treatment of patients with cirrhosis and those with HBeAg-positive or HBeAg-negative active disease.

Guidelines do not recommend routine treatment in the immune-tolerant phase. These patients are usually below the age of 30-40 and at low risk of near-term liver cirrhosis or HCC, and current treatments rarely result in functional cure.

## Incidence of HCC in High Risk Groups With HBV

| Group                                  | Incidence of HCC (%/year)          |
|----------------------------------------|------------------------------------|
| Asian male; HBV > age 40               | 0.4–0.6                            |
| Asian female; HBV > age 50             | 0.3–0.6                            |
| HBV with HCC family history            | Higher than without family history |
| African/North American Blacks with HBV | HCC occurs at younger age          |
| HBV cirrhosis                          | 3–8                                |
| HCV cirrhosis                          | 3–5                                |

- Over 50% of HCC cases worldwide are related to chronic HBV, accounting for approximately 700,000 to 800,000 new cases of HCC annually
- The annual incidence of HCC is estimated at less than 1% for non-cirrhotic patients and between 3-8% for patients with cirrhosis
- HCC risk associated with HBV is lower in the US vs. Asian-Pacific and sub-Saharan Africa
- 55% of all HCC cases worldwide stem from China

## Takeaways From the 2019 EASL-AASLD HBV Treatment Endpoints Conference

1. A “functional” cure is achievable and should be defined as sustained HBsAg loss (based on assays with lower limit of detection [LLOD] ~0.05 IU/mL) in addition to undetectable HBV DNA 6 months post-treatment.
  - Covalently closed circular (ccc) DNA is still present in the liver in very small amounts or in a transcriptionally inactive state, and integrated HBV DNA is still present. Thus, HBV reactivation can occur spontaneously or upon immunosuppression.
2. The primary endpoint of phase III trials should be functional cure; HBsAg loss with or without anti-HBs seroconversion 6 months after treatment, plus HBV DNA to undetectable levels.
  - HBsAg loss in  $\geq 15\%$  of patients is deemed clinically significant by GSK.
3. Sustained virologic suppression (undetectable serum HBV DNA) without HBsAg loss 6 months after discontinuation of treatment would be an intermediate goal.
4. Demonstrated validity for the prediction of sustained HBsAg loss was considered the most appropriate criterion for the approval of new HBV assays to determine efficacy endpoints.
5. Clinical trials aimed at HBV functional cure should initially focus on patients with HBeAg-positive or -negative chronic hepatitis, who are treatment-naïve or virally suppressed on nucleos(t)ide analogues.
6. A hepatitis flare associated with an increase in bilirubin or international normalized ratio should prompt temporary or permanent cessation of an investigational treatment.
7. New treatments must be as safe as existing nucleos(t)ide analogues.

## Time Course of Potential Viral Responses to NA Therapy

Source: EASL CPG HBV. J Hepatol 2017;67:370-98/ EASL HBV 2020 Report

# Potential Outcomes in Patients with HBeAg-negative CHB After NA Treatment Discontinuation

Virologic relapse (HBV DNA >2,000 IU/mL and clinical relapse (HBV DNA >2,000 IU/mL and ALT >2x ULN) are common when NA treatment is discontinued.

## EASL Patient Monitoring Recommendations

### Monitoring recommendations

#### ALT and serum HBV DNA

- All patients treated with NAs

#### Renal monitoring

- Patients at risk of renal disease treated with any NA
- All patients treated with TDF, regardless of renal risk

#### Switch to ETV or TAF

- Should be considered in patients on TDF at risk of development of, and/or with, underlying renal or bone disease

### Long-term surveillance recommendations

#### HCC surveillance recommended

- All patients under effective long-term NA therapy

#### HCC surveillance mandatory

- All patients with cirrhosis or with moderate or high HCC risk scores at the onset of NA therapy

# Recommendations for Treatment of Patients With HBeAg-Negative, Immune-Active CHB

---

## AASLD 2018 Hepatitis B Guidance

### **Patients with HBeAg-Negative, Immune-Active Adults With Chronic Hepatitis B**

- AASLD recommends indefinite antiviral therapy for adults with HBeAg-negative, immune-active CHB
- Antiviral therapy is not recommended for persons without cirrhosis who are HBeAg-negative with normal ALT activity and low-level viremia (<2,000 U/mL; “inactive” CHB)

Source: <https://pubmed.ncbi.nlm.nih.gov/29405329/>

# Recommendations for Treatment of Patients with Immune-Active Disease

## AASLD 2018 Hepatitis B Guidance

### Patients with Immune Active Disease

- Antiviral therapy (peg-IFN, entecavir, or tenofovir) is recommended for adults with immune-active CHB (HBeAg-negative or HBeAg-positive) to decrease the risk of liver-related complications
  - Note: Immune-active CHB is defined by an elevation of ALT  $\geq 2x$  the ULN or evidence of significant histologic disease plus elevated HBV DNA above 2,000 IU/mL (HBeAg-negative) or above 20,000 IU/mL (HBeAg-positive)
- Therapy is recommended for persons with immune-active CHB and cirrhosis if HBV DNA is  $>2,000$  IU/mL, regardless of ALT level
- Head-to-head comparisons of antiviral therapies fail to show superiority of one therapy over another in achieving risk reduction in liver-related complications
- For patients treated with peg-IFN, 48 weeks' duration is used in most studies and is preferred. This treatment duration yields HBeAg seroconversion rates of 20%-31% and sustained off-treatment HBV-DNA suppression of  $<2,000$  IU/mL in 65% of persons who achieve HBeAg to anti-Hbe seroconversion. The combination of peg-IFN has not yielded higher rates of off-treatment serological or virological responses and is not recommended
- Treatment with antivirals does not eliminate the risk of HCC, and surveillance for HCC should continue in persons who are at risk

Source: <https://pubmed.ncbi.nlm.nih.gov/29405329/>

# Recommendations for Treatment of Patients with Immune-Tolerant Disease

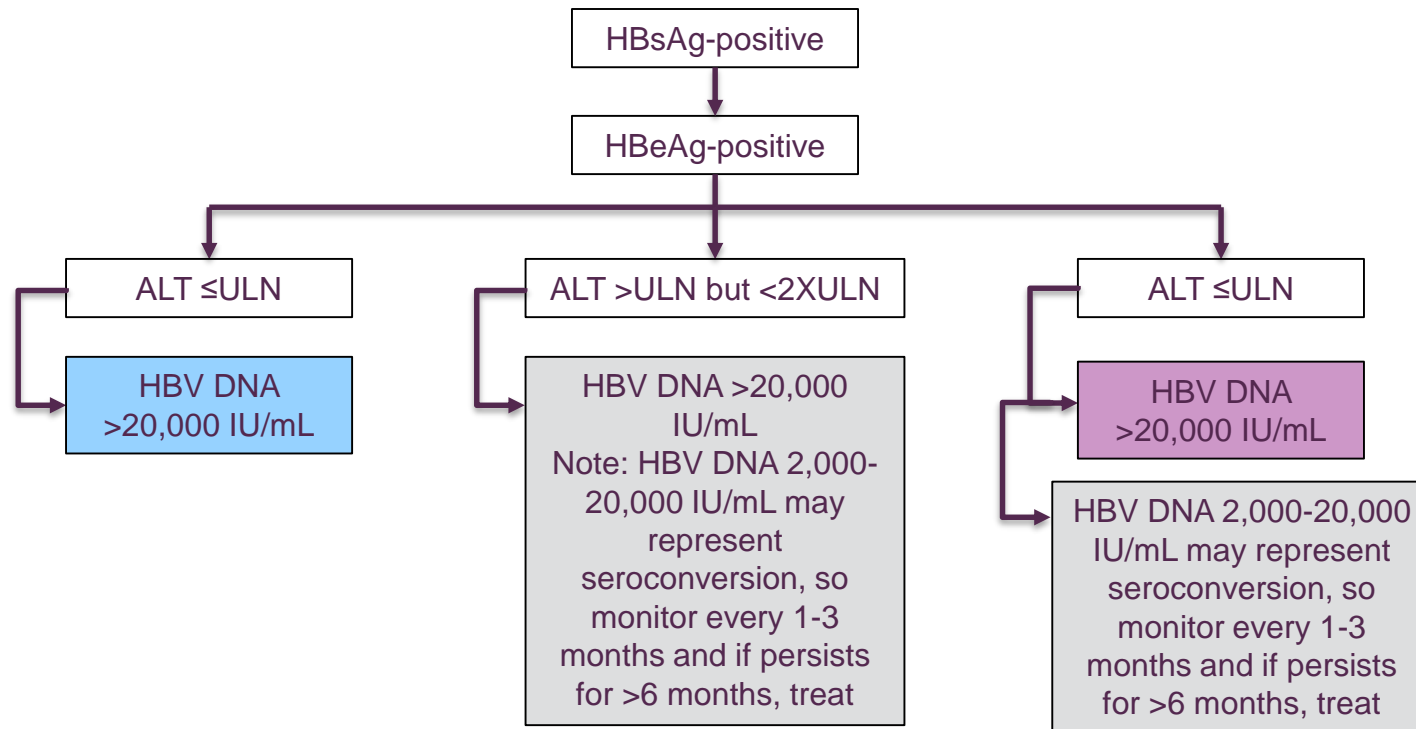

## AASLD 2018 Hepatitis B Guidance

### **Patients with Immune-Tolerant Adults With Chronic Hepatitis B**

- AASLD recommends against antiviral therapy for adults with immune-tolerant CHB
- Note: Immune-tolerant status should be defined by ALT levels, utilizing 35 U/L for men and 25 U/L for women as ULN rather than local laboratory ULN
- ALT levels should be tested at least every 6 months for adults with immune tolerant CHB to monitor for potential transition to immune-active or immune-inactive CHB
- Antiviral therapy is recommended in adults >40 years of age with normal ALT and elevated HBV DNA (1,000,000 IU/mL) and liver biopsy specimen showing significant necroinflammation or fibrosis
- Moderate-to-severe necroinflammation or fibrosis on a liver biopsy specimen is a reason to consider initiation of antiviral therapy if other causes of liver disease are excluded

Source: <https://pubmed.ncbi.nlm.nih.gov/29405329/>

# Treatment Flow Chart for HBsAg-Positive Persons Without Cirrhosis & HBeAg-Positive

## Recommendations:

Treat

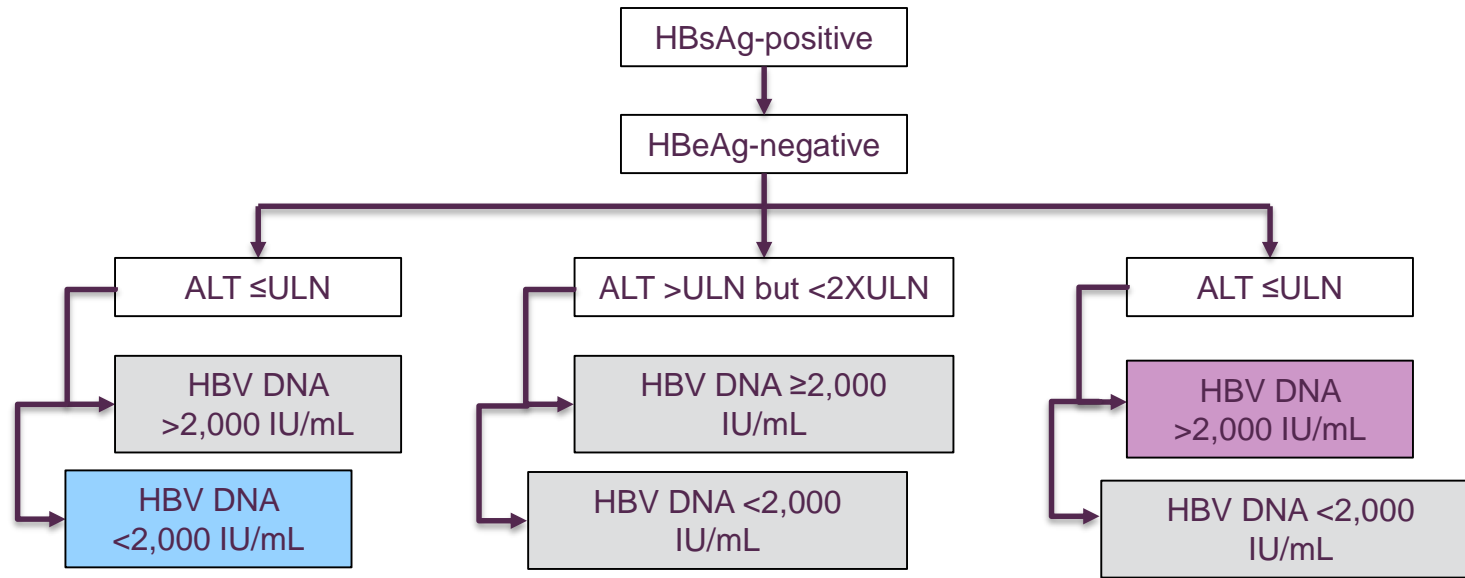

Do not treat. Monitor with ALT and HBV DNA levels every 3-6 months and HBeAg every 6-12 months

Exclude other causes of ALT elevation and assess disease severity with non-invasive tests and/or liver biopsy. If staging indicates  $\geq F2$  or  $\geq A3$ , treat. If other causes of ALT > ULN exclude and elevations persists, treat, especially if age > 40

Source: <https://pubmed.ncbi.nlm.nih.gov/29405329/>

# Treatment Flow Chart for HBsAg-Positive Persons Without Cirrhosis & HBeAg-Negative

## Recommendations:

Treat

Do not treat. Monitor with ALT and HBV DNA levels every 3-6 months and HBsAg annually

If ALT < ULN, monitor ALT and HBV DNA every 3 months for 1 year, then every 6 months.

If ALT elevated, exclude other causes of ALT elevation and assess disease severity with non-invasive tests and/or liver biopsy. If staging indicates ≥F2 or ≥A3, treat. If persistent ALT > ULN with HBV DNA ≥ 2000 IU/mL, treat, especially if age > 40

Source: <https://pubmed.ncbi.nlm.nih.gov/29405329/>

# Tenofovir alafenamide (TAF) vs. Tenofovir disoproxil fumarate (TDF) Change in eGFR in HBV Patients

Median change from baseline in eGFR over 96 weeks  
TAF 25 mg (n=866) vs. TDF 300 mg (n=432)

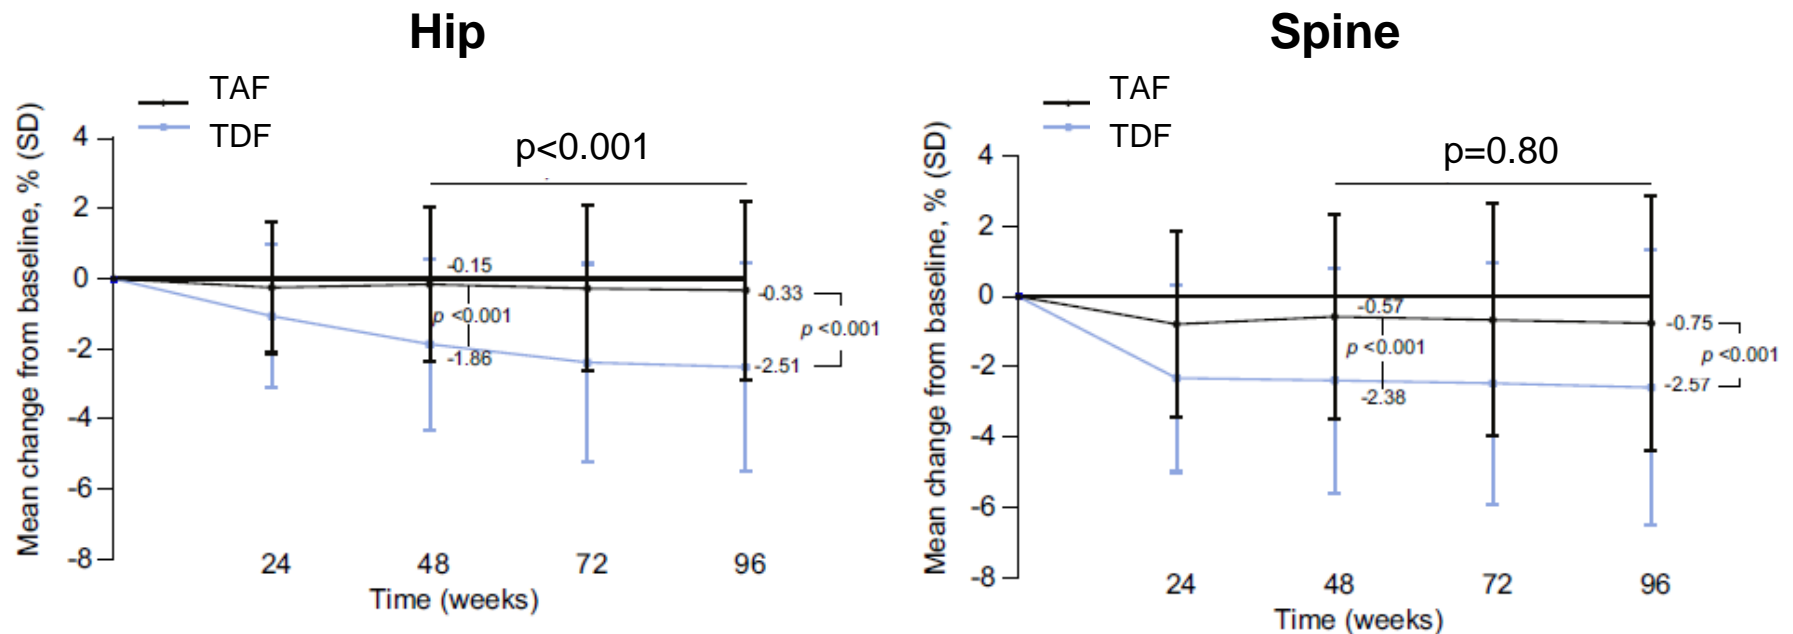

TAF leads to an approximate -1.2% change in eGFR from baseline over 96 weeks vs. -4.8% change in eGFR from baseline for TDF.

## Assessment of ALT Elevations During CHB Treatment

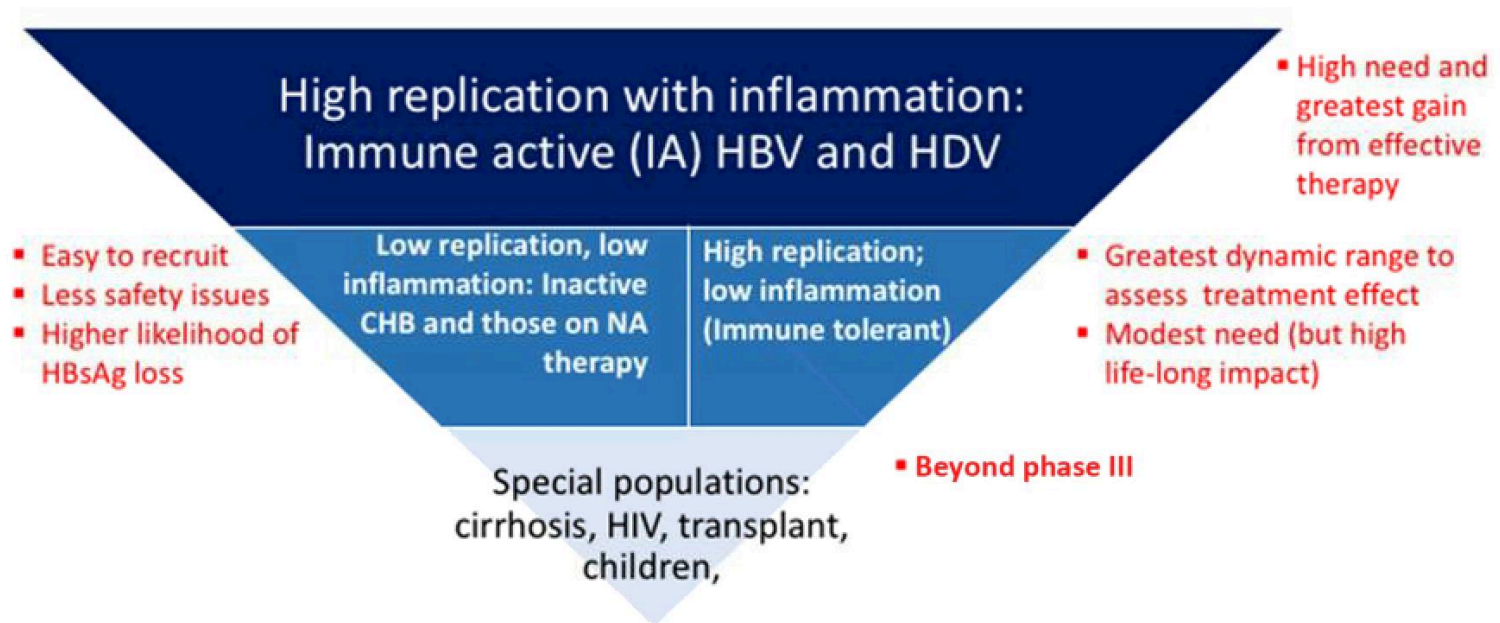

ALT elevations represent a major concern in HBV drug development. Due to known elevated liver enzymes at baseline, guidelines have proposed a new evaluation matrix based on baseline and post-treatment ALT levels. Elevations associated with an increase in bilirubin, INR, or hepatic decompensation require discontinuation of treatment.

### Guidelines Stopping Criteria in HBV Patients with ALT Flares During Treatment

| Baseline ALT Value     | Elevation During Treatment      |
|------------------------|---------------------------------|
| 1 to < 2x ULN          | >5x from baseline and > 10x ULN |
| 2x to less than 5x ULN | >3x from baseline               |
| ≥ 5x ULN               | >2x from baseline               |

Source: <https://pubmed.ncbi.nlm.nih.gov/31713892/>

## Prioritization of Patient Populations for Clinical Trials

- Patients with immune-active CHB, high levels of HBV replication >20,000 IU/mL, and hepatic inflammation have the greatest immediate need for treatment
- Patients with HBeAg-positive infection (immune tolerant phase), who have low risk of liver complications, specifically if less than 30 years old, may benefit from a finite therapy with high rate of HBsAg loss. Most of this group are without fibrosis, thus functional cure would likely prevent long-term liver complications
- Due to potential heterogeneity, consideration should be given to baseline HBsAg, HBV DNA or ALT levels, HBeAg status, combination of treatments, and genotype stratification during trial design

# Can siRNA + Immunomodulator Combos Match Bepi?

## - Data from VIR, ROG-SWX and EASL 2024

## VIR: Utilizing Two Approaches with Potential for Achieving a Functional Cure (1/3)

| VIR-2218-1001 TRIAL                                                             |                                                    | MARCH TRIAL                                        |  |
|---------------------------------------------------------------------------------|----------------------------------------------------|----------------------------------------------------|--|
| elebsiran + PEG-IFN- $\alpha$                                                   | tobevibart + elebsiran                             | tobevibart + elebsiran + PEG-IFN- $\alpha$         |  |
| EOT after 24w Tx<br><b>5.6%</b><br>(N=1 of 18)<br>HBsAg seroclearance           | <b>15.0%</b><br>(N=3 of 20)<br>HBsAg seroclearance | <b>14.3%</b><br>(N=3 of 21)<br>HBsAg seroclearance |  |
| EOT after 48w Tx<br><b>25.8%</b><br>(N=8 of 31)<br>HBsAg seroclearance          | <b>Q4 2024</b>                                     |                                                    |  |
| 24w Off Tx (Post-48w Tx)<br><b>16.1%</b><br>(N=5 of 31)<br>Sustained HBsAg loss | <b>Q2 2025</b>                                     |                                                    |  |

Vir’s approach includes: Tobevibart (neutralizing mAb engineered for immune engagement) + Elebsiran (siRNA) with or without Peg-IFN. Data indicate 3x increase in HBsAg seroclearance adding Tobevibart on top of elebsiran – potentially implying immunoactivity components of the mAb.

Vir plants to update MARCH Trial data sets in Q4 2024 and Q2 2025, respectively.

Source: VIR Corporate Presentation

# VIR: mAb Immune Complex Generation may Enhance Immunostimulation (2/3)

Tobevibart may contain natural immunostimulatory properties based on mAb:antigen immune complexes leading to generation of CD4 and CD8 T cells.

Available data suggests VIR-2218 (elebsiran; siRNA) combined with VIR-3434 (tobevibart; mAb) elicits a similar immune response vs. siRNA + Peg-IFN. The highest anti-HBs concentrations were observed in the 2 participants in the VIR-2218 + VIR-3434 + PEG-IFN $\alpha$  cohort who maintained HBsAg loss through 12 weeks post end of treatment.

Source: VIR Corporate Presentation

# VIR: Peg-IFN on Top of VIR-2218 (Elebsiran; siRNA) + VIR-3434 (Tobevibart; mAb) May be Necessary to Drive Sustained Functional Cures Based on Preliminary Data (3/3)

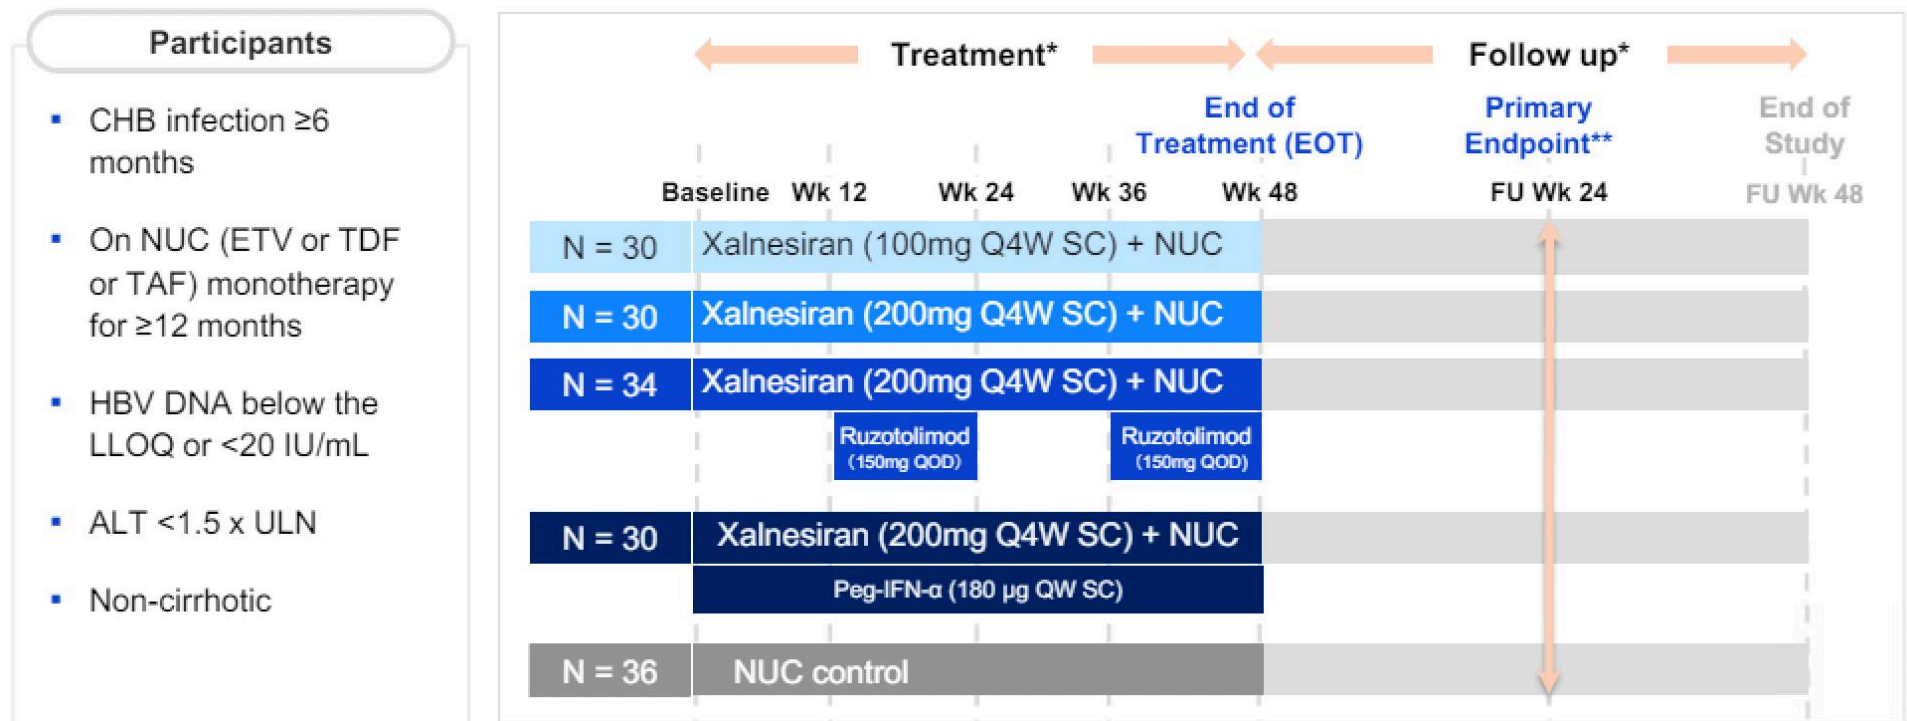

Per the company:

At 12 weeks post-EOT, 2 participants in the VIR-2218 + VIR-3434 + PEG-IFNα cohort maintained HBsAg loss; all other participants with HBsAg loss at EOT experienced a rebound

EOT, end of treatment; HBsAg, hepatitis B surface antigen; LLOQ, lower limit of quantitation.

# Roche: Primary Endpoint Results from the Phase 2, Randomized, Controlled, Adaptive, Open-Label Platform Study (PIRANGA) (1/2)

## PIRANGA Trial Design

Roche examined the combination of Xalnesiran (HBV siRNA) plus immunomodulators, including:

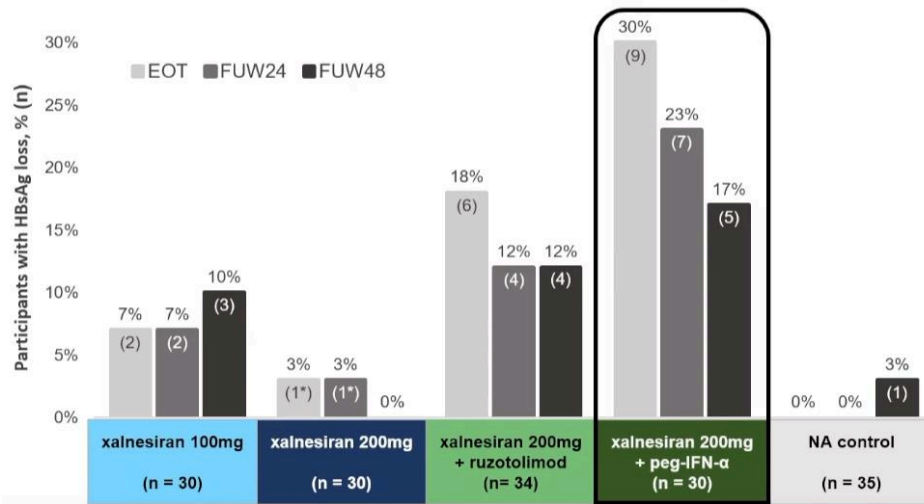

- 1) Ruzotolimod (TLR7 agonist) - Double pro-drug selectively activated in the liver designed to stimulate cytokine production and dendritic cell activation, or;
- 2) Peg-IFN – To inducer innate antiviral immune response.

The primary endpoint was percentage of participants with HBsAg loss at 24 weeks post end of treatment.

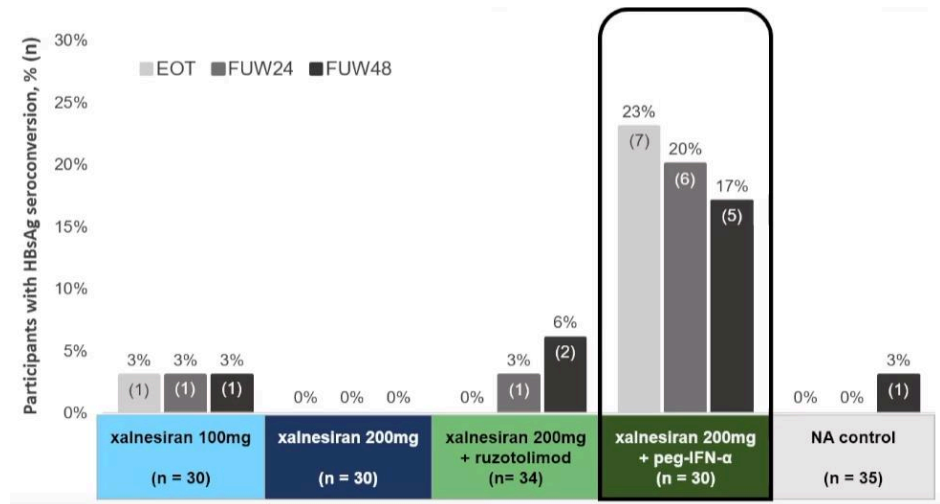

Source: <https://medically.roche.com/content/dam/pdmahub/restricted/oncology/apasl-2024/APASL-2024-presentation-hou-efficacy-and-safety-of-xalnesiran.pdf>

# Roche: HBsAg Loss Observed only in Participants with Baseline HBsAg <1000 IU/mL (2/2)

## HBsAg loss at EOT and through 48-week post-treatment follow-up

## HBsAg seroconversion at EOT, and at follow-up weeks 24 and 48

All participants with HBsAg loss had undetectable HBV RNA by 24 weeks post end of treatment.

HBsAg loss observed only in participants with baseline HBsAg <1000 IU/mL.

HBsAg seroconversion at 48 weeks post end of treatment included:

- n=5 xalnesiran+Peg-IFN
- n=2 xalnesiran+ruzotolimod
- n=1 xalnesiran 100mg

Roche's siRNA appears to perform best in combination with Peg-IFN.

# PBGENE-HBV

## - The Potential of Curative HBV Editing

# PBGENE-HBV's Target Site Conserved Across >92% of Isolates Across Genotypes

Precision's ARCUS editor recognizes a highly conserved sequence in cccDNA that is present in greater than 92% of isolates across genotypes.

Targeted sequence in integrated HBV DNA (bp 1,259-1,280) is highly conserved across viral variants.

ARCUS recognizes its target in the 23S rRNA gene, eliminating cccDNA and inactivating integrated HBV DNA to produce durable antigen loss.

Source: DTIL AASLD 2023 Poster; DTIL Corporate Deck

# Final Optimized Clinical Candidate (PBGENE-HBV) Demonstrates Up to 99% Viral Engagement

NHPs were administered AAVs containing HBV cccDNA, with subsequent 2 doses of PBGENE-HBV.

The optimized PBGENE-HBV ARCUS editor resulted in 81% eliminated cccDNA and 18% indels of cccDNA, measured at day 90.

We anticipate PBGENE-HBV will be the first gene editor tailored for multi-course treatment in humans.

2 Doses of PBGENE-HBV 42 Days Apart in NHPs

Source: DTIL Corporate Deck

## Dual-Course PBGENE-HBV Results in Transient ALT/AST Elevations

DTIL examined the safety of dual-course PBGENE-HBV in an NHP model. Transient ALT and AST elevations were observed following LNP +/- ARCUS administration, which returned to baseline approximately 7 days after therapeutic administration.

Of note, there was no incremental ALT/AST elevation following the second dose of LNP injection, suggesting no memory-based immune response to ARCUS editors.

Source: [https://precisionbiosciences.com/wp-content/uploads/2024/06/PBGENEHBV-EASL-2024-poster\\_final.pdf](https://precisionbiosciences.com/wp-content/uploads/2024/06/PBGENEHBV-EASL-2024-poster_final.pdf)

# PBGENE-HBV Final Clinical Candidate Optimized for Enhanced Specificity

ARCUS-POL v.3 editor maintains on-target potency and achieves no off-target editing across 384 potential off-target sites. Prior generation ARCUS-POL v.2 demonstrated considerably higher off-target editing.

Source: DTIL AASLD 2023 Poster

# In Episomal Mouse Model, PBGENE-HBV Resulted in 95% HBsAg Reduction

PBGENE-HBV was administered at day 21 post AAV administration. Treatment demonstrated 95% viral engagement (elimination and inactivation through indels) and 95% HBsAg reduction.

Source: DTIL Corporate Deck

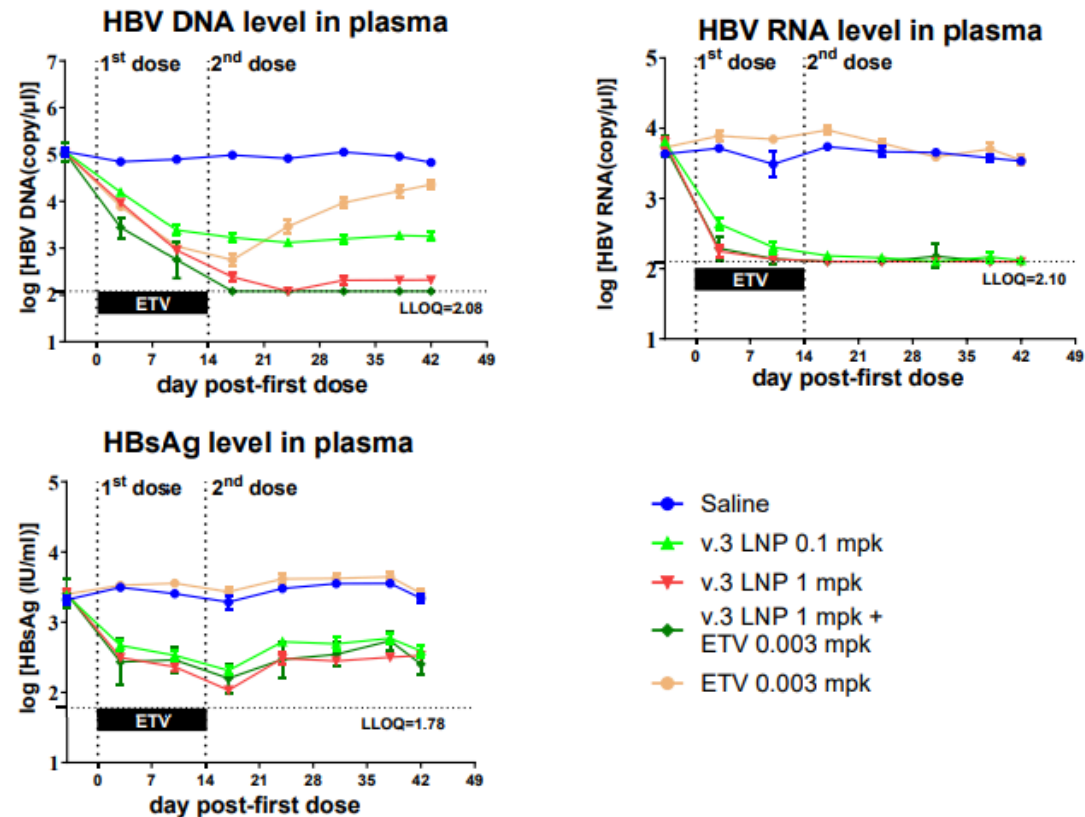

# In Transgenic Mouse Model, PBGENE-HBV Resulted in Significant HBV DNA Reduction

PBGENE-HBV was administered twice, 14 days apart. Treatment durably reduced HBV DNA (as measured in plasma) after stopping nucleos(t)ide analog.

Source: DTIL Corporate Deck

# Fully Optimized ARCUS-POL v.3 Durably Reduces HBV DNA, HBV RNA, and HBsAg in Transgenic HBV Mouse Model

Mice were administered two doses of ARCUS-POL v.3 fourteen days apart or in combination with a 14-day course of entecavir. HBV DNA and HBV RNA reached the LLOQ, and HBsAg trended toward the LLOQ.

# Assembly Bio (ASMB): Focused on Transforming Treatment of Serious Viral Diseases

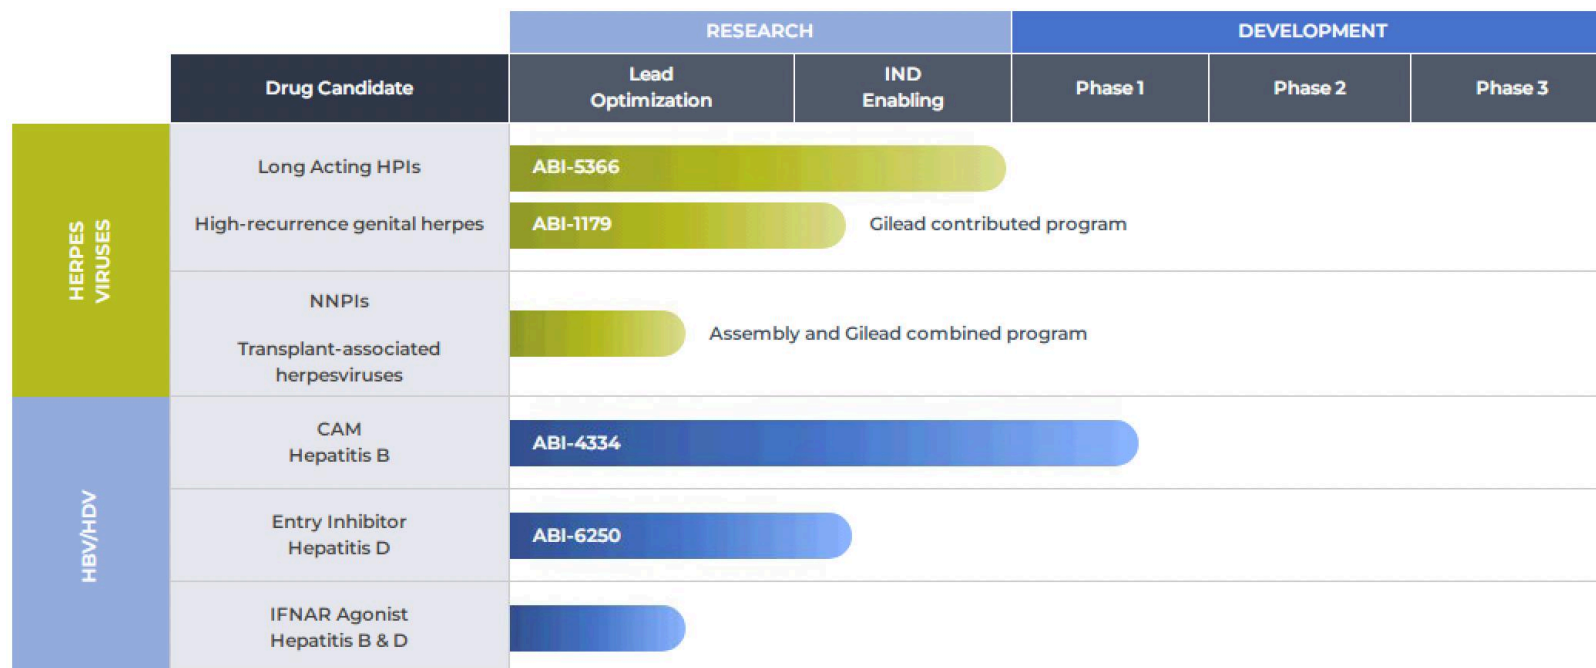

### Select Members of Management

- CEO: Jason Okazaki
- CSO: William Delaney, PhD
- CMO: Anuj Gaggar, MD, PhD

### Company Description

Assembly’s pipeline includes a clinical-stage therapeutic candidate for the treatment of chronic HBV and development candidates for the treatment of high-recurrence genital herpes and chronic HDV.

HPI: Helicase-primase inhibitor; NNPI: Non-nucleoside polymerase inhibitor; CAM: Capsid assembly modulator; IFNAR: Interferon- $\alpha$  receptor

# Viravaxx (Private): Preventive and Therapeutic Vaccines and Diagnostics for Hepatitis B, SARS-CoV-2, HIV, RSV and Rhinovirus

### Select Members of Management

- CEO: Dr. Walter Baumann

### Company Description

Viravaxx AG is a privately held company based in Vienna, Austria, with a flagship vaccine against Hepatitis B. The newly developed vaccine is a step towards the therapeutic as well as prophylactic use of vaccination against chronic Hepatitis B. The vaccine has already been tested successfully in clinical studies.

## NEW VACCINES AND DIAGNOSTICS

| VIRAVAXX AG * | R&D | Preclinical studies | Clinical studies Phase 1 | Clinical studies Phase 2 |
|---------------|-----|---------------------|--------------------------|--------------------------|
| Hepatitis B   | →   |                     |                          |                          |
| SARS-CoV-2    | →   |                     |                          |                          |
| HIV           | →   |                     |                          |                          |

**ANALYST CERTIFICATION**

By issuing this research report, each Guggenheim Securities, LLC ("Guggenheim Securities") research analyst whose name appears in this report hereby certifies that (i) all of the views expressed in this report accurately reflect the research analyst's personal views about any and all of the subject securities or issuers discussed herein and (ii) no part of the research analyst's compensation was, is, or will be directly or indirectly related to the specific recommendations or views expressed by the research analyst.

**IMPORTANT DISCLOSURES**

The research analyst(s) whose name(s) appear(s) in this report have received compensation based upon various factors, including quality of research, investor client feedback, and Guggenheim Securities, LLC's overall revenue, which includes investment banking revenue.

Please refer to this website for company-specific disclosures referenced in this report: <https://guggenheimsecurities.bluematrix.com/sellside/Disclosures.action>. Disclosure information is also available from Compliance, 330 Madison Avenue, New York, NY 10017.

**RATINGS EXPLANATION AND GUIDELINES**

**BUY (B)** - Describes stocks that we expect to provide a total return (price appreciation plus yield) of 10% or more within a 12-month period.

**NEUTRAL (N)** - Describes stocks that we expect to provide a total return (price appreciation plus yield) of between plus 10% and minus 10% within a 12-month period.

**SELL (S)** - Describes stocks that we expect to provide a total negative return (price appreciation plus yield) of 10% or more within a 12-month period.

**NR** - The investment rating and price target have been temporarily suspended. Such suspensions are in compliance with applicable regulations and/or Guggenheim Securities, LLC policies.

**CS** - Coverage Suspended. Guggenheim Securities, LLC has suspended coverage of this company.

**NC** - Not covered. Guggenheim Securities, LLC does not cover this company.

**Monitor** - Describes stocks whose company fundamentals and financials are being monitored, and for which no financial projections or opinions on the investment merits of the company are provided.

**Under Review (UR)** - Following the release of significant news from this company, the rating has been temporarily placed under review until sufficient information has been obtained and assessed by the analyst.

Guggenheim Securities, LLC methodology for assigning ratings may include the following: market capitalization, maturity, growth/value, volatility and expected total return over the next 12 months. The price targets are based on several methodologies, which may include, but are not restricted to, analyses of market risk, growth rate, revenue stream, discounted cash flow (DCF), EBITDA, EPS, cash flow (CF), free cash flow (FCF), EV/EBITDA, P/E, PE/growth, P/CF, P/FCF, premium (discount)/average group EV/EBITDA, premium (discount)/average group P/E, sum of the parts, net asset value, dividend returns, and return on equity (ROE) over the next 12 months.

Price targets are assigned for Buy- and Sell-rated stocks. Price targets for Neutral-rated stocks are provided at the discretion of the analyst.

**Equity Valuation and Risks:** For valuation methodology and risks associated with covered companies or price targets for covered companies, please see the most recent company-specific research report at <https://guggenheimlibrary.bluematrix.com/client/library.jsp>, contact the primary analyst or your Guggenheim Securities, LLC representative, or email [GSRResearchDisclosures@guggenheimpartners.com](mailto:GSRResearchDisclosures@guggenheimpartners.com).

**RATINGS DISTRIBUTIONS FOR GUGGENHEIM SECURITIES:**

| Rating Category | Count | Percent | IB Serv./ Past 12Mos. |         |
|-----------------|-------|---------|-----------------------|---------|
|                 |       |         | Count                 | Percent |
| BUY             | 259   | 68.16%  | 52                    | 20.08%  |
| HOLD            | 114   | 30.00%  | 5                     | 4.39%   |
| SELL            | 7     | 1.84%   | 0                     | 0.00%   |

Guggenheim Securities Research assigns Buy, Neutral, Sell ratings for covered securities. Such assignments equate to Buy, Hold and Sell for the purposes of the above Rating Distribution Disclosure required by FINRA Rule 2241.

**OTHER DISCLOSURES**

This research is for our clients and prospective clients only. This research was prepared by personnel who are associated with both Guggenheim Securities, LLC (a FINRA-registered broker-dealer, "Guggenheim Securities") and Guggenheim Securities Research Services, LLC (an investment adviser, "GSRs," and together with Guggenheim Securities, "Guggenheim"). If you are paying separately for this research, it is being provided to you by GSRs. Otherwise, it is being provided by Guggenheim Securities. Guggenheim does not create tailored or personalized research and all research provided by Guggenheim is impersonal advice. Other than disclosures relating to Guggenheim and our affiliates, this research is based on current public information that we consider reliable, but we do not represent it is accurate or complete, and it should not be relied on as such. We seek to update our research as appropriate, but various regulations may prevent us from doing so. Other than certain industry reports published on a periodic basis, the large majority of reports are published at irregular intervals as appropriate in the research analyst's judgement. Guggenheim Securities conducts a full-service, integrated investment banking and brokerage business. Guggenheim Securities is a member of SIPC (<http://www.sipc.org>). Guggenheim Securities' salespeople, traders, and

other professionals may provide oral or written market commentary or trading strategies to Guggenheim Securities' clients and our employees trading for our own account that reflect opinions that are contrary to the opinions expressed in this research. Guggenheim and certain of our affiliates conduct an investment management business, trade for their own accounts, and may make investment decisions that are inconsistent with the recommendations or views expressed in this research.

We and our affiliates, officers, directors, and employees, excluding equity and credit analysts, will from time to time have long or short positions in, act as principal in, and buy or sell, the securities or derivatives, if any, referred to in this research. We and our affiliates also may sell to or buy from customers on a principal basis the securities described herein. We and our affiliates also do business with, or that relates to, companies covered in Guggenheim research and may have a position in the debt of the company or companies discussed herein.

This research is not an offer to sell or the solicitation of an offer to buy any security. It does not constitute a personal recommendation or take into account the particular investment objectives, financial situations, or needs of individual clients. Clients should consider whether any advice or recommendation in this research is suitable for their particular circumstances and, if appropriate, seek professional advice, including tax advice. The price and value of investments referred to in this research and the income from them will fluctuate. Past performance is not a guide to future performance, future returns are not guaranteed, and a loss of original capital may occur. Fluctuations in exchange rates could have adverse effects on the value or price of, or income derived from, certain investments.

This communication does not constitute an offer of Shares to the public in the United Kingdom. No prospectus has been or will be approved in the United Kingdom in respect of the Securities. Consequently, this communication is directed only at (i) persons who are outside the United Kingdom or (ii) persons who have professional experience in matters relating to investments falling within Article 19(5) of the Financial Services and Markets Act 2000 (Financial Promotion) Order 2005 (the "Order"), (iii) high net worth entities falling within Article 49(2) of the Order (iv) and other persons to whom it may lawfully be communicated (all such persons together being referred to as "relevant persons"). Any investment activity to which this communication relates will only be available to, and will only be engaged with, relevant persons. Any person who is not a relevant person, or otherwise in a territory where it is not intended to, or may not, be distributed, should not act or rely on this document or any of its contents.
